Wnt Signaling and Developmental Logic in Human Stem Cell Populations Ian Joseph Huggins, 2016 Human development is complex Countless molecular events guide a single cell and its daughters through processes like cell division differentiation and even death to produce a free living organism that comprises trillions of cells multiple organs and a complex brain capable of adaptation emotion and invention To achieve this end cells have evolved a highly complex system of signals to communicate with each other throughout development and into adulthood The Wnt signaling pathway is key among such developmental signals and is required for multicellular animal life The role of the Wnt signaling pathway in early human development is poorly understood Using human pluripotent stem cells hPSCs and human neural stem cells hNSCs I have undertaken a series of studies designed to elucidate the functions of the Wnt pathway in these models of early human development In Chapter 1 I introduce hPSCs their derivatives such as hNSCs and their potential as a model system I discuss

the Wnt signaling pathway and its roles in development and disease Finally I introduce the transcription factor SP5 which I discovered is an important target of Wnt signaling in hPSCs and hNSCs In Chapter 2 I describe high throughput RNA sequencing expression analysis of Wnt3a treated hPSCs I identify SP5 as a key transcriptional target and characterize its binding genome wide by chromatin immunoprecipitation followed by sequencing I demonstrate that SP5 functions by repressing Wnt antagonist genes and that this activity restricts the formation of definitive endoderm in Wnt treated hPSCs In Chapter 3 I describe the effects of Wnt pathway activation on pluripotency and differentiation to early germ layers I further discuss the novel role of Wnt signaling as a negative regulator of EGR1 expression In Chapter 4 I demonstrate the effects of Wnt signaling on hNSC multipotency and differentiation I describe high throughput RNA sequencing expression analysis of Wnt3a treated hNSCs I identify FGF family members and SP5 as key transcriptional targets and demonstrate their roles promoting hNSC multipotency and proliferation In Chapter 5 I discuss the broader implications of my findings and speculate on the subject and results of future work in the field

Hematopoiesis Leonard I. Zon, 2001-04-12 Hematopoiesis or the process of blood formation has been extensively studied at both basic and clinical levels Human diseases such as thalassemia immunodeficiency and leukemia represent defects in this process Approaches to treat these disorders have required a basic understanding of the biology of blood cells For instance hemapoietic stem cell replacement or bone marrow transplantation has been used to ameliorate disease This volume focuses on hematopoiesis at a cellular and molecular level and establishes the basis for clinical manipulation of hematopoietic cells for therapeutic benefit In Part I the cellular characteristics of progenitors and stem cells are explored Emphasis is placed on purification of stem cells and both in vitro and in vivo assays The regulation of normal and leukemis stem cells is illustrated An excellent discussion of potential use of these cells for gene therapy concludes this section Hemapoesis is easily studied during embryogenesis Part II develops the concept of the waves of hemapoesis during development Comparative hematology is making a major comeback as a field in the 1990 s One hope is that general principles of hematopoiesis will be established by studying many models and systems Part III delves into critical factors that regulate hematopoiesis including both intracellular and extracellular signals Part IV and V describe lineage programs for myeloid and lymphoid lineages These chapters are meant to be illustrative of the different cell fates but are not exhaustive Part VI examines the genetics of hematopoisis particularly in animal models The hematopoietic system is in constant contact with stromal cells and endothelial cells during development and in the adult Evidence suggests that endothelial cells and blood cells may arise from a common progenitor the hemangioblast Part VII and VIII discuss the stromal and endothelial cells with the emphasis on their interaction with hematopoietic cells

Wnt/[beta]-catenin Signaling in Vertebrate Posterior Neural Development Yaniv Elkouby, Yaniv M. Elkouby, Dale Frank, 2010 The Wnt catenin signaling pathway is a key regulator of cell fate specification differentiation and growth in multiple systems throughout the animal kingdom In vertebrate posterior neural development Wnt catenin signaling controls this complex multistep process It initially induces the posterior regions of the nervous system including the mid hindbrain border hindbrain spinal cord and neural crest and then subsequently fine tunes the pattern of each region and determines the different cell fates within them In this review we explore the function of the Wnt catenin pathway during the formation of these specific posterior neural regions We have examined the important transcriptional targets of the Wnt catenin pathway acting downstream to mediate its morphogenetic activity Different regulatory networks are activated in different posterior neural regions and these networks induce specific neural cell types in each region Elucidating how each of these networks specify different cell fates is crucial for understanding the basic tenets of how Wnt morphogenetic activity induces the posterior nervous system during the earliest stages of vertebrate development
