Ultrasensitive Laser Spectroscopy David Kliger, 2012-12-02 Ultrasensitive Laser Spectroscopy covers the experimental methods involved in various sensitive techniques to which lasers have been applied for the study of weak transitions This book is organized into seven chapters Each chapter discusses the theories experiments and application of the specific technique A discussion on the advantages disadvantages and modifications made in each technique is also provided Ultrasensitive techniques considered in this text include photoacoustic one and two photon excitation absorption mass and laser ionization spectroscopies Other chapters examine the techniques of laser intracavity enhanced laser absorption and emission spectroscopy This book will be of value to spectroscopists analytical chemists and researchers in the field of ultrasensitive analysis

Ultrasensitive Laser Spectroscopy, 1985 **Ultrasensitive Laser Spectroscopy in Solids: Single-Molecule Detection**, 1989 In spite of detection intensity constraints necessary to avoid power broadening the optical absorption spectrum of single molecules of pentacene in p terphenyl crystals can be measured by 1 using laser FM spectroscopy combined with Stark and or ultrasonic double modulation to remove residual amplitude modulation and 2 recording spectra far out in the wings of the inhomogeneous line to reduce the number of molecules in resonance to one

Ultrasensitive Laser Spectroscopy in Solids: Statistical Fine Structure and Single-Molecule Detection, 1990 Detailed studies of the low temperature inhomogeneously broadened $0\ 0\ S\ 1\ S\ 0$ electronic transition of pentacene dopant molecules in p terphenyl crystals have produced two novel observations which open up a new regime for ultra sensitive laser spectroscopy in solids The first result direct detection of intrinsic static absorption fine structure on a megaHertz scale called statistical fine structure arises from number fluctuations in the spectral density of absorbers which scale as the square root of the number of absorbers per homogeneous width Surprisingly this effect provides a new method for determining the homogeneous width that does not rely on hole burning or coherent transients The second recent observation detection of the optical absorption of a single pentacene molecule in a p terphenyl crystal opens the door to new studies of single local environments in solids as well as to studies of the interactions of a single absorber with external perturbations in which no averaging is performed over large numbers of nominally equivalent local configurations Both achievements utilized high sensitivity variations of laser frequency modulation spectroscopy to perform the measurement Keywords Statistical fine structure Atomic properties Single molecule detection Molecule properties Laser spectroscopy of solids Instrumentation Pentacene in p terphenyl Organic compounds Near field *Ultrasensitive High Resolution Laser Spectroscopy and Its Application to Optical Frequency Standards* Jun Ye, 1997 [Laser-based Ultrasensitive Spectroscopy and Detection V.](#) Society of Photo-optical Instrumentation Engineers.
