

General relativity

From the world learned of the revolutionary Special Theory of Relativity proposed by Albert Einstein and published in 1905, physics underwent its most revolutionary change since the days of Isaac Newton. Nevertheless, Einstein had yet another surprise left: the so-called General Theory of Relativity, of 1916—a much more complex and complete theory from which several interesting predictions arise and have been confirmed over time.

Why a second theory?

According to Einstein, the laws of physics are the same for all observers, but the way they are perceived is different. Einstein's theory of relativity is a generalization of Newton's theory of gravity, which is only valid in the case of weak gravitational fields. Einstein solved the problem of providing an theory by providing an equivalent principle.

A deformed universe

Einstein established that gravity was not a force, but rather the consequence of the deformation of space-time that any body with mass generates. Mass, when accumulating in a point, deforms the space around it, and objects do not move through that curved deformation.

The most characteristic example of this deformation is the bending of light rays.

Light that bends

Perhaps the most surprising confirmation of one of Einstein's predictions, based on the General Theory of Relativity, happened in 1919 during the course of a solar eclipse.

According to the General Theory of Relativity, the light rays from the stars are deflected by the gravitational field of the Sun. This deflection is more pronounced when the Sun is closer to the observer, and it is also more pronounced when the light rays are closer to the Sun.

In 1919, Arthur Eddington was the first to observe this effect. He observed the stars during a total solar eclipse, and he found that the light rays from the stars were indeed deflected by the gravitational field of the Sun.

4 dimensions

For the universe according to Einstein's theory, although the space is three-dimensional, time is also a dimension, and together they form a four-dimensional spacetime.

Gravitational lenses

Another prediction based on the General Theory of Relativity concerns gravitational lenses. Because of the deformation of space-time caused by the gravitational field, the light rays from a distant object are deflected as they pass by a massive body.

The bending of light rays is a direct consequence of the deformation of space-time caused by the gravitational field. This bending is more pronounced when the light ray is closer to the massive body.

The bending of light rays is a direct consequence of the deformation of space-time caused by the gravitational field. This bending is more pronounced when the light ray is closer to the massive body.

ALBERT EINSTEIN

The most revolutionary prediction of the General Theory of Relativity is the prediction of gravitational waves. These waves are ripples in the fabric of space-time that propagate at the speed of light. They were first predicted by Einstein in 1916, and their existence was confirmed in 2015 by the LIGO experiment.

Electromagnetic waves

Einstein showed that in certain gravitational fields, light rays can be deflected. This deflection is more pronounced when the light ray is closer to the massive body. This effect is known as gravitational lensing.

Perturbation of Mercury's orbit

Astronomers had discovered a discrepancy in the orbital motion of the planet Mercury that could not be explained by Newton's theory of gravity. Einstein's theory of relativity provided a solution to this problem.

The discrepancy in Mercury's orbit was a direct consequence of the deformation of space-time caused by the Sun's gravitational field. This deformation causes the orbit to precess, which was observed by astronomers.
