 growing interest in control problems today connected with the urgent problems of the effective use of natural resources  
 manpower materials and technology When referring to the most important achievements of science and technology in the  
 20th Century one usually mentions the splitting of the atom the exploration of space and computer engineering Achievements  
 in control theory seem less spectacular when viewed against this background but the applications of control theory are  
 playing an important role in the development of modern civilization and there is every reason to believe that this role will be  
 even more significant in the future Wherever there is active human participation the problem arises of finding the best or  
 optimal means of control The demands of economics and technology have given birth to optimization problems which in turn  
 have created new branches of mathematics In the Forties the investigation of problems of economics gave rise to a new  
 branch of mathematical analysis called linear and convex programming At that time problems of controlling flying vehicles  
 and technological processes of complex structures became important A mathematical theory was formulated in the mid  
 Fifties known as optimal control theory Here the maximum principle of L S Pontryagin played a pivotal role Optimal control  
 theory synthesized the concepts and methods of investigation using the classical methods of the calculus of variations and  
 the methods of contemporary mathematics for which Soviet mathematicians made valuable contributions *Numerical*
