[New Methods in Financial Modeling](#) Houston H. Stokes,Hugh Neuburger,1998-02-18 The authors present a number of financial market studies that have as their general theme the econometric testing of the underlying econometric assumptions of a number of financial models More than 30 years of financial market research has convinced the authors that not enough attention has been paid to whether the estimated model is appropriate or most importantly whether the estimation technique is suitable for the problem under study For many years linear models have been assumed with little or no testing of alternative specification The result has been models that force linearity assumptions on what clearly are nonlinear processes Another major assumption of much financial research constrains the coefficients to be stable over time This critical assumption has been attacked by Lucas 1976 on the grounds that when economic policy changes the coefficients of macroeconomics models change If this occurs any policy forecasts of these models will be flawed In financial modeling omitted possibly non quantifiable variables will bias

coefficients While it may be possible to model some financial variables for extended periods in other periods the underlying models may either exhibit nonlinearity or show changes in linear models The authors research indicates that tests for changes in linear models such as recursive residual analysis or tests for episodic nonlinearity can be used to signal changes in the underlying structure of the market The book begins with a brief review of basic linear time series techniques that include autoregressive integrated moving average models ARIMA vector autoregressive models VAR and models from the ARCH GARCH class While the ARIMA and VAR approach models the first moment of a series models of the ARCH GARCH class model both the first moment and second moment which is interpreted as conditional or explained volatility of a series Recent work on nonlinearity detection has questioned the appropriateness of these essentially linear approaches A number of such tests are shown and applied for the complete series and a subsets of the series A major finding is that the structure of the series may change over time Within the time frame of a study there may be periods of episodic nonlinearity episodic ARCH and episodic nonstationarity Measures are developed to measure and relate these events both geographically and with mathematical models This book will be of interest to applied finance researchers and to market participants Building Financial Models, Chapter 7 - Building a Pilot Model John Tjia, 2009-05-27 This chapter is from Building Financial Models widely acclaimed by accounting and finance professionals for its insight into determining a company s current value and projecting its future performance Building on this tradition the updated and expanded Second Edition helps readers develop a financial model complete with entirely new material on discounted cash flow DCF modeling Professionals will find this guide invaluable for both its practical step by step approach to creating a core model and its broad coverage of model mechanics and foundational accounting and finance concepts
