Water Reactor Fuel Extended Burnup Study International Atomic Energy Agency,1992 *Extended-burnup LWR Fuel* W. J. Bailey,Pacific Northwest Laboratory,United States. Department of Energy,1989 **Energy Research Abstracts**,1985 **Energy Research Abstracts**,1992 Includes all works deriving from DOE other related government sponsored information and foreign nonnuclear information **Annual Report** International Atomic Energy Agency,1991 **Nuclear Fuel Cycle Simulation System (VISTA)** International Atomic Energy Agency,2007 The Nuclear Fuel Cycle Simulation System VISTA is a simulation system which estimates long term nuclear fuel cycle material and service requirements as well as the material arising from the operation of nuclear fuel cycle facilities and nuclear power reactors It is a scenario based simulation tool which can model several nuclear fuel cycle options including existing nuclear power reactor types and future possible reactor types The past operations of the power reactors and fuel cycle facilities can be modelled in the system in order to estimate the current amount of spent fuel stored or total Pu in stored spent fuel It can also accept future projections for nuclear power and other scenario parameters in order to predict future fuel cycle material requirements The model has been designed to be an optimum mixture of simplicity speed and accuracy It does not require too many input parameters if the purpose is just to compare the requirements for selected scenarios Furthermore the accuracy of the system can be improved by introducing more detailed and correct sets of input parameters *IAEA Nuclear Science Publications, Catalogue* International Atomic Energy Agency,1980 *Extension of Fuel Burnup in Light Water Reactors by Using a Strict In-out Refueling Scheme* Julian Yu-liang Yen,1982 To utilize energy resources as efficiently as possible has become a necessity today The purpose of this study is to see how this can be done by extending burnup in a light water reactor Specifically an in out refueling scheme might extract the maximum energy from nuclear fuel during its residence in the reactor In principle a reactor loading with minimum neutron leakage and minimum parasitic absorption will best utilize the neutrons For this having more fissions near the center of the reactor will reduce leakage and parasitic absorption by control elements could be reduced by having smaller reactivity changes between reloads An in out refueling scheme i e loading the fresh fuel into the center of the reactor moving the older fuel outward and removing the oldest fuel from the edge could best utilize the reactivity of fresh fuel This is because neutron importance is highest in the center Placing control preferentially near the center then requires relatively less absorption in control elements to achieve a given degree of reactor control The non uniform flux distribution with peaking at the center will save neutrons because the fuel assemblies of the lowest neutron production capability are located at the edge of the reactor and leakage from these fuels is neither very large nor very important To simulate the in out operation of the reactor in this study two computer codes have been established One is a one dimensional code utilizing two group diffusion equations in an iteration scheme and the other is a two dimensional code using spatial flux synthesis Studies have been made of the effects of the in out refueling scheme on reactor cycle length fuel

burnup level power peaking factor and other reactor characteristics Results show that an in out refueling scheme could have a fuel burnup benefit over the conventional out in refueling scheme The benefit can be up to 13 percent or more depending on the frequency of refueling the fuel design and the reactor size compared with out in refueling under the same circumstances The in out refueling scheme with short cycle length gets part of its benefit from frequent refueling However frequent refueling tends to expose the fuels at the center of the core to very high power peak ing Peaking is a function of batch size the smaller the batch size the higher the peak and is closely related to the initial reactivity of the fuel as well as to the method of fuel management High power peaking can be alleviated by confining the reactivity controlling absorber to the center of the reactor Moreover with this type of control the cycle length and discharge burnup become larger for a given replacement batch size than for a case in which control is applied over the whole core Enrichment certainly could elongate the cycle length and so the discharge burnup but the gain of burnup per enrichment increment decreases with enrichment level Lattice design could also have some effects on the discharge burnup More moderation of neutrons in a looser lattice increases the initial reactivity of the fuel although it speeds up the rate of reactivity loss per flux time The low conversion of the fertile material in the fuel of a loose lattice does not apparently have as much influence on the discharge burnup as the initial reactivity does *Technical Reports Series* ,1989 **Journal of Nuclear Science and Technology** ,1984
