Encyclopedia of Modern Coral Reefs David Hopley,2010-11-26 Coral reefs are the largest landforms built by plants and animals Their study therefore incorporates a wide range of disciplines This encyclopedia approaches coral reefs from an earth science perspective concentrating especially on modern reefs Currently coral reefs are under high stress most prominently from climate change with changes to water temperature sea level and ocean acidification particularly damaging Modern reefs have evolved through the massive environmental changes of the Quaternary with long periods of exposure during glacially lowered sea level periods and short periods of interglacial growth The entries in this encyclopedia condense

the large amount of work carried out since Charles Darwin first attempted to understand reef evolution. Leading authorities from many countries have contributed to the entries covering areas of geology, geography, and ecology, providing comprehensive access to the most up-to-date research on the structure, form, and processes operating on Quaternary coral reefs. *The Wave* (Algernon Blackwood, 1916) and *American Journal of Physiology* (1916) Vols for 1898, 1941, 1948, 56 include the Society's proceedings, primarily abstracts of papers presented at the 10th, 53rd annual meetings, and the 1948, 56 fall meetings. *Journal and Proceedings of the Royal Society of New South Wales* (Royal Society of New South Wales, 1879) includes list of members.
