*Wavelets in Geodesy and Geodynamics* Wolfgang Keller, 2008-08-22 For many years digital signal processing has been governed by the theory of Fourier transform and its numerical implementation The main disadvantage of Fourier theory is the underlying assumption that the signals have time wise or space wise invariant statistical properties In many applications the deviation from a stationary behavior is precisely the information to be extracted from the signals Wavelets were developed to serve the purpose of analysing such instationary signals The book gives an introduction to wavelet theory both in the continuous and the discrete case After developing the theoretical fundament typical examples of wavelet analysis in the Geosciences are presented The book has developed from a graduate course held at The University of Calgary and is directed to graduate students who are interested in digital signal processing The reader is assumed to have a mathematical background on the graduate level

**GPS Stochastic Modelling** Xiaoguang Luo, 2013-07-06 Global Navigation Satellite Systems GNSS such as GPS have become an efficient reliable and standard tool for a wide range of applications However when processing GNSS data the stochastic model characterising the precision of observations and the correlations between them is usually simplified and incomplete leading to overly optimistic accuracy estimates This work extends the stochastic model using signal to noise ratio SNR measurements and time series analysis of observation residuals The proposed SNR based observation weighting model significantly improves the results of GPS data analysis while the temporal correlation of GPS observation noise can be efficiently described by means of autoregressive moving average ARMA processes Furthermore this work includes an up to date overview of the GNSS error effects and a comprehensive description of various mathematical
