Jørgensen, 2007-10-17 If people do not believe that mathematics is simple it is only because they do not realize how complicated life is John von Neumann While this is a course in analysis our approach departs from the beaten path in some ways Firstly we emphasize a variety of connections to themes from neighboring fields such as wavelets fractals and signals topics typically not included in a graduate analysis course This in turn entails excursions into domains with a probabilistic flavor Yet the diverse parts of the book follow a common underlying thread and together they constitute a good blend each part in the mix naturally complements the other In fact there are now good reasons for taking a wider view of analysis for example the fact that several applied trends have come to interact in new and exciting ways with traditional mathematical analysis as it was taught in graduate classes for generations One consequence of these impulses from outside is that conventional boundaries between core disciplines in mathematics have become more blurred Fortunately this branching out does not mean that students will need to start out with any different or additional prerequisites In fact the ideas involved in this book are intuitive natural many of them visual and geometric The required background is quite minimal and it does not go beyond what is typically required in most graduate programs
