## **The Mammalian Circulation:**

**The Mammalian Circulation** Eric Neil,1975      **The Heart and Circulation** Branko Furst,2013-08-13 This book traces the development of the basic concepts in cardiovascular physiology in the light of the accumulated experimental and clinical evidence and rather than making the findings fit the standard pressure propulsion mold let the phenomena speak for themselves It starts by considering the early embryonic circulation where blood passes through the valveless tube heart at a rate that surpasses the contractions of its walls suggesting that the blood is not propelled by the heart but possesses its own motive force tightly coupled to the metabolic demands of the tissues Rather than being an organ of propulsion the heart on the contrary serves as a damming up organ generating pressure by rhythmically impeding the flow of blood The validity of this model is then confirmed by comparing the key developmental stages of the cardiovascular system in the invertebrates the insects and across the vertebrate taxa The salient morphological and histological features of the myocardium are reviewed with particular reference to the vortex The complex energy dissipating intracardiac flow patterns likewise suggest that the heart functions as an organ of impedance whose energy consumption closely matches the generated pressure but not its throughput Attention is then turned to the regulation of cardiac output and to the arguments advanced by proponents of the left ventricular and of the venous return models of circulation Hyperdynamic states occurring in arteriovenous fistulas and congenital heart defects where communication exists between the systemic and pulmonary circuits at the level of atria or the ventricles demonstrate that once the heart is unable to impede the flow of blood reactive changes occur in the pulmonary and systemic circulations leading to pulmonary hypertension and Eisenmenger syndrome Finally the key points of the book are summarized in the context of blood as a liquid organ with autonomous movement      *Comparative Cardiovascular Dynamics of Mammals* John K-J Li,2024-11-01 *Comparative Cardiovascular Dynamics of Mammals* offers never before published data on the structure and function of the circulatory systems of the different mammalian species This text explores classic allometry dimensional analysis and modern hemodynamics to establish similarity principles that provide a necessary and important step in understanding the natural common design and functional features of the cardiovascular systems of different mammals Fluid and blood vessel mechanics pulse transmission characteristics cardiac energetics and mechanics as well as heart arterial system interaction are included in this essential reference The sensitivity of parameters and similarity of principles in the diagnosis of cardiovascular diseases are also addressed This book also describes the natural processes involved in the functional development of the mammalian cardiovascular system By using modern methods to present recent findings on the similarities and differences of the mammalian cardiovascular system the author provides an easily understood approach to this dynamic field of study      *Cambridge International AS and A Level Biology Coursebook with CD-ROM* Mary Jones,Richard Fosbery,Jennifer Gregory,Dennis Taylor,2012-11 A series of titles which provides full support for the Cambridge International AS and A Level Biology syllabus Cambridge International AS and A Level Coursebook provides

students with a full introduction to the AS and A Level syllabus and comprehensive support for their examination The experienced author team have reviewed the core text expanded the Applications of Biology chapters and added two new chapters on practical skills Each chapter now has a set of exam style practice questions as well as questions to help review the material Also included are advice on how to revise and prepare for the examinations multiple choice questions revision summaries and answers to all book questions
