

Split-splitless Injector

Split-splitless injectors are used for introduction of highly concentrated samples into capillary columns. Sample is volatilized by injection into a heated glass liner. The carrier gas then either sweeps the total sample (Splitless mode) or a portion (Split mode) into the column. The split vent controls the amount of sample entering and the other portion is exhausted. This mode is useful for highly concentrated or dirty samples. It helps in producing narrow band widths. Split-less injection is useful for trace level analysis.
