The Human Semantic Potential Spatial Language And Constrained Connectionism:

The Human Semantic Potential Terry Regier, 1996 Drawing on ideas from cognitive linguistics connectionism and perception The Human Semantic Potential describes a connectionist model that learns perceptually grounded semantics for natural language in spatial terms Languages differ in the ways in which they structure space and Regier's aim is to have the model perform its learning task for terms from any natural language The system has so far succeeded in learning spatial terms from English German Russian Japanese and Mixtec The model views simple movies of two dimensional objects moving relative to one another and learns to classify them linguistically in accordance with the spatial system of some natural language The overall goal is to determine which sorts of spatial configurations and events are learnable as the semantics for spatial terms and which are not Ultimately the model and its theoretical underpinnings are a step in the direction of articulating biologically based constraints on the nature of human semantic systems Along the way Regier takes up such substantial issues as the attraction and the liabilities of PDP and structured connectionist modeling the problem of learning without direct negative evidence and the area of linguistic universals which is addressed in the model itself Trained on spatial terms from different languages the model permits observations about the possible bases of linguistic universals and interlanguage variation

The Human Semantic Potential Terry Regier, 1996-08 Regier's work makes a distinct and tangible contribution to the study of cognition and should be read by anyone interested in language acquisition in particular and learning in general This work brings about an impressive integration of ideas from cognitive linguistics connectionism and computer science in order to attack the problem of learning perceptually grounded semantics of spatial terms The research reported in this book is an excellent example of interdisciplinary work Lokendra Shastri Member AI Group International Computer Science Institute Berkeley Regier develops a structured connectionist model for acquiring spatial concepts that represents the epitome of cognitive science integrating perspectives from linguistics artificial intelligence and psychology This work further represents an excellent example of how a complex model should be analyzed to establish its core properties implications and limitations Besides having considerable scientific merit the book is highly engaging frequently provocative and beautifully written Lawrence W Barsalou Professor of Psychology University of Chicago Drawing on ideas from cognitive linguistics connectionism and perception The Human Semantic Potential describes a connectionist model that learns perceptually grounded semantics for natural language in spatial terms Languages differ in the ways in which they structure space and Regier's aim is to have the model perform its learning task for terms from any natural language The system has so far succeeded in learning spatial terms from English German Russian Japanese and Mixtec The model views simple movies of two dimensional objects moving relative to one another and learns to classify them linguistically in accordance with the spatial system of some natural language The overall goal is to determine which sorts of spatial configurations and events are learnable as the semantics for spatial terms and which are not Ultimately the model and

From Perception to Meaning Beate Hampe, 2008-08-22 The 1987 landmark publications by G Lakoff and M Johnson made image schema one of the cornerstone concepts of the emerging experientialist paradigm of Cognitive Linguistics a framework founded upon the rejection of the mind body dichotomy and stressing the fundamentally embodied nature of meaning imagination and reason hence language Conceived of as the pre linguistic dynamic and highly schematic gestalts arising directly from motor movement object manipulation and perceptual interaction image schemas served to anchor abstract reasoning and imagination to sensori motor patterns in the conceptual theory of metaphor Being

itself informed by preceding crosslinguistic work on semantic primitives in the linguistic representations of spatial relations carried out by L Talmy R Langacker and others the notion has inspired a large amount of subsequent research and debate on diverse issues ranging from the meaning structure and acquisition of natural languages to the embodied mind itself From Perception to Meaning is the first survey of current image schema theory and offers a collection of original and innovative essays by leading scholars many of whom have shaped the theory from the very beginning The edition unites essays on major issues in recent research on image schemas from aspects of their definition and linguistic formalization their psychological status and neural grounding to their role as semantic universals and primitives in language acquisition The book will thus not only be welcomed by linguists of a cognitive orientation but will prove relevant to philosophers psychologists and anthropologists interested in language and indeed to anyone studying the embodied mind Cognitive Linguistics and Non-Indo-European Languages Eugene H. Casad, Gary B. Palmer, 2008-08-22 This book applies the theory of cognitive linguistics to the analysis of a variety of grammatical phenomena in non Indo European languages In previous studies of languages from non Indo European families cognitive linguistics has been remarkably useful in explaining non prototypical structures as well as more common ones The book expands that effort into a new set of families and languages

Conceptual Structures: Standards and Practices William M. Tepfenhart, Walling Cyre, 2007-07-23 With all of the news about the Internet and the Y2K problem it is easy to forget that other areas of computer science still exist Reading the newspaper or watching the television conveys a very warped view of what is happening in computer science This conference illustrates how a maturing subdiscipline of computer science can continue to grow and integrate within it both old and new approaches despite or perhaps due to a lack of public awareness The conceptual graph community has basically existed since the 1984 publication of John Sowa's book Conceptual Structures Information Processing In Mind and Machine In this book John Sowa laid the foundations for a knowledge representation model called conceptual graphs based on semantic networks and the existential graphs of C S Peirce Conceptual graphs constitutes a very powerful and expressive knowledge representation scheme inheriting the benefits of logic and the mathematics of graphs The expressiveness and formal underpinnings of conceptual graph theory have attracted a large international community of researchers and scholars The International Conferences on Conceptual Structures and this is the seventh in the series is the primary forum for these researchers to report their progress and activities As in the past the doors were open to admit alternate representation models and approaches *Space in Languages* Maya Hickmann, Stéphane Robert, 2006-01-01 Space is presently the focus of much research and debate across disciplines including linguistics anthropology psychology and philosophy One strong feature of this collection is to bring together theoretical and empirical contributions from these varied scientific traditions with the collective aim of addressing fundamental questions at the forefront of the current literature the nature of space in language the linguistic relativity of space the relation between spatial language and cognition Linguistic analyses highlight

the multidimensional and heterogeneous nature of space while also showing the existence of a set of types parameters and principles organizing the considerable diversity of linguistic systems and accounting for mechanisms of diachronic change Findings concerning spatial perception and cognition suggest the existence of two distinct systems governing linguistic and non linguistic representations that only partially overlap in some pathologies but they also show the strong impact of language specific factors on the course of language acquisition and cognitive development
