

# Theoretical Probability

The theoretical probability of an event occurring is

$$\text{Theoretical probability} = \frac{\text{frequency of the event occurring}}{\text{total frequency of possible outcomes}}$$

**Mutually exclusive events** cannot happen at the same time.

For example, a fair die cannot land on a 3 and a 4 at the same time and a coin flip cannot land on heads and tails at the same time.

If an object (a coin, spinner, or dice for example) is described as **fair**, or **unbiased**, the theoretical probability of each outcome is the same; the theoretical probability of flipping a tails on a fair coin is  $\frac{1}{2}$ , the theoretical probability of rolling a 2 on a fair 6-sided dice is  $\frac{1}{6}$ .
