What is epilepsy?

Epilepsy is a long-term condition characterized by recurrent, unprovoked seizures. These are caused by abnormal electrical activity in the brain, which can be triggered by a variety of factors, including genetic factors, brain injury, infection, and stroke.

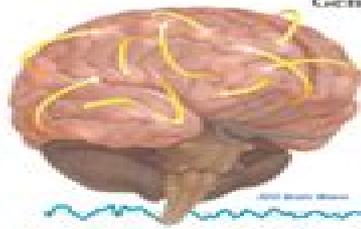

What is an epileptic seizure?

An epileptic seizure is a sudden, unprovoked burst of abnormal electrical activity in the brain. This activity can cause a variety of symptoms, including loss of consciousness, muscle spasms, and changes in behavior.

Partial seizures are characterized by abnormal electrical activity in a specific area of the brain. This activity can cause a variety of symptoms, including changes in sensation, movement, or consciousness.

Generalized seizures

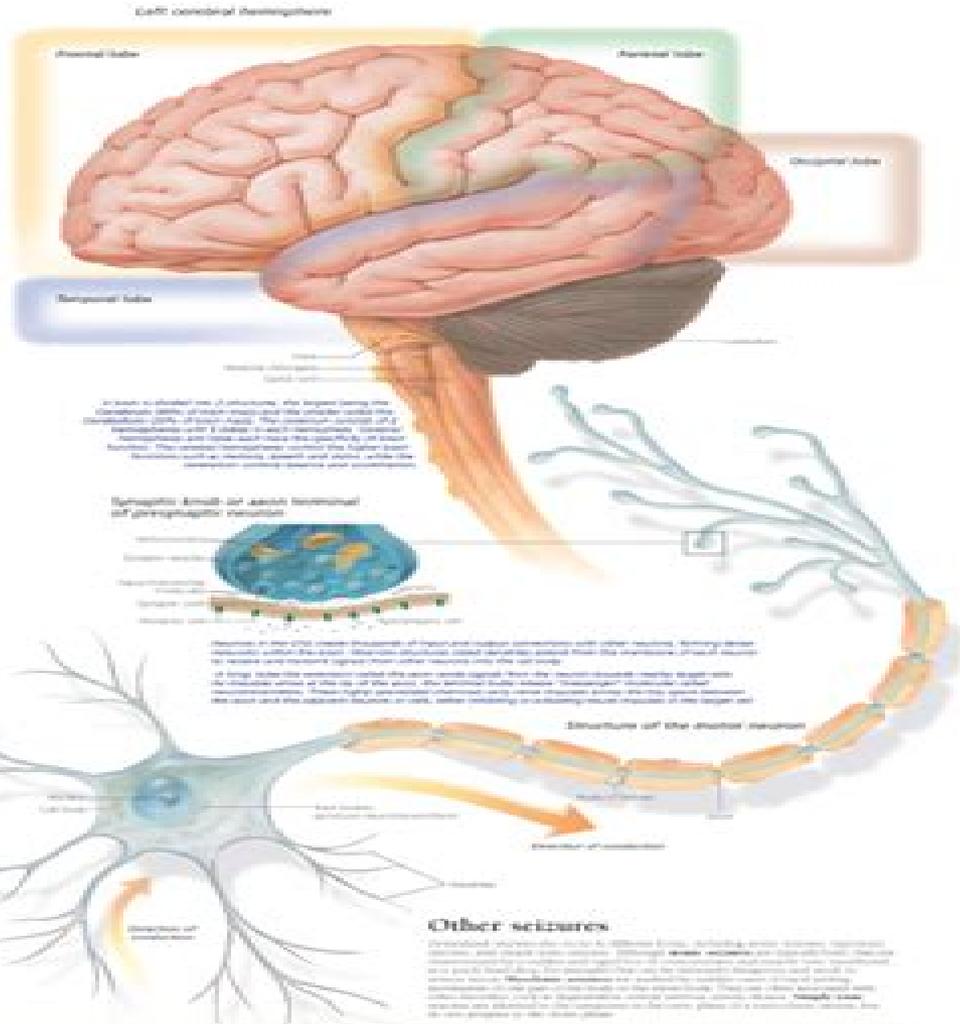

Generalized seizures involve abnormal electrical activity that spreads across the entire brain. This activity can cause a variety of symptoms, including loss of consciousness, muscle spasms, and changes in behavior.

Partial (focal) seizures

Partial (focal) seizures involve abnormal electrical activity that is localized to a specific area of the brain. This activity can cause a variety of symptoms, including changes in sensation, movement, or consciousness.

Diagnosing and treating epilepsy

The diagnosis of epilepsy is based on a combination of factors, including a detailed history of the patient's seizures, a physical examination, and an EEG. Treatment options include medication, surgery, and lifestyle changes.

Managing your epilepsy

Managing epilepsy involves taking medication as prescribed, avoiding triggers, and maintaining a healthy lifestyle. Regular follow-up with a healthcare provider is essential for monitoring the condition and adjusting treatment as needed.
