

# Probability formula

Probability formulas are used to calculate the probabilities of events

Finding the probability of an event  $A$  happening can be calculated using the formula

$$P(A) = \frac{\text{Number of times } A \text{ occurs}}{\text{Total number of possible outcomes}}$$

$$P(\text{not } A) = 1 - P(A)$$

$$\text{For mutually exclusive events: } P(A \text{ or } B) = P(A) + P(B)$$

$$\text{For independent events: } P(A \text{ and } B) = P(A) \times P(B)$$

**Illinois Pure Water Committee, Inc. V. Director of the Department of Public Health of the State of Illinois**, 1983 **Adequate Connections** James B. Freeman, 2025-03-25 This book presents a comprehensive picture of when the premises of an argument are adequately connected to its conclusion The author draws upon the familiar Toulmin model Rescher s discussion of presumption and burden of proof and L Jonathan Cohen s presentation of the method of relevant variables The book first assesses the warrant or inference rule connecting the premises to the conclusion To analyzes this the author asks a series of questions such as should the warrant be evaluated by conclusive or defeasible standards Does the argument require that its premises if acceptable guarantee that the conclusion is acceptable also or does it allow the premises just to present a body of relevant evidence Is the inference rule backed or supported a priori or a posteriori These

distinctions form four categories of warrants conclusive a priori defeasible a posteriori defeasible a priori and virtually conclusive a posteriori The warrants in each category are evaluated differently for how strongly the premises support the conclusion of arguments instancing those warrants After presenting the rationale for this division and discussing our nonprobabilistic approach the author analyzes the connection adequacy for each of these types of warrants This book is of interest to scholars of argumentation theory
