Understanding Parallel Supercomputing:

Understanding Parallel Supercomputing R. Michael Hord,1998-08-17 UNDERSTANDING PARALLEL SUPERCOMPUTING is an exhaustive applications oriented survey of the world s largest and fastest computers Beginning with the evolution of parallel supercomputing technology in recent history author R Michael Hord goes on to illustrate architectural concepts and implementations at the very center of today s cutting edge technology Topics featured include technology benefits and drawbacks software tools and programming languages major programming concepts sample parallel programs algorithmic methods both SIMD and MIMD architectures This carefully written text will be of interest to engineers scientists and program managers involved in geologic exploration aircraft design image processing weather modeling operations research chemical synthesis and medical applications It will also be of practical use to computer specialists

Martin,1988 Although supercomputer systems are faster and have larger memory hierarchies than other computer systems such characteristics merely imply the existence of great potential power How much of that power can be harnessed productively is the central theme of performance evaluation A set of methods for evaluating the performance of applications on supercomputers has not yet been rigorously defined This volume is a compilation of research approaches and techniques that are a promising means to that end The contributions are grouped into three sections Contributors to Performance looks at applications algorithms compilers operating systems and memory issues Measurements and Metrics addresses some of the current techniques and methods of performance evaluation Among the topics are the performance monitoring capabilities of the CEDAR system the methodology behind the Livermore loops the empirical analysis of system performance and a software simulator developed in connection with the RP3 project Methods Models and Directions looks at ways of establishing a general and theoretical framework for supercomputer performance evaluation

Crockett,Institute for Computer Applications in Science and Engineering,1994 Abstract Applications which run on parallel supercomputers are often characterized by massive datasets Converting these vast collections of numbers to visual form has proven to be a powerful aid to comprehension For a variety of reasons it may be desirable to provide this visual feedback at runtime One way to accomplish this is to exploit the available parallelism to perform graphics operations in place In order to

do this we need appropriate parallel rendering algorithms and library interfaces This paper provides a tutorial introduction to some of the issues which arise in designing parallel graphics libraries and their underlying rendering algorithms The focus is on polygon rendering for distributed memory message passing systems We illustrate our discussion with examples from PGL a parallel graphics library which has been developed on the Intel family of parallel systems
