The Impact of Binary Stars on Stellar Evolution Giacomo Beccari, Henri M. J. Boffin, 2019-04-18 Stars are mostly found in binary and multiple systems with at least 50% of all solar like stars having companions this fraction approaches 100% for the most massive stars A large proportion of these systems interact and alter the structure and evolution of their components leading to exotic objects such as Algol variables blue stragglers and other chemically peculiar stars but also to phenomena such as non spherical planetary nebulae supernovae and gamma ray bursts While it is understood that binaries play a critical role in the Initial Mass Function the interactions among binary systems significantly affect the dynamical evolution of stellar clusters and galaxies This interdisciplinary volume presents results from state of the art models and observations aimed at studying the impact of binaries on stellar evolution in resolved and unresolved populations Serving as a bridge between observational and theoretical astronomy it is a comprehensive review for researchers and advanced students of astrophysics

Observational Imprints of Binary Evolution on B- and Be-star Populations Julia Bodensteiner, 2022-11-30 This book presents novel observational evidence toward detecting and characterizing the products of massive interacting binary stars As a majority of massive stars are born in close binary systems a large number of so called massive binary interaction products are predicted to exist however few have been identified so far Based on observations with the largest telescopes around the world equipped with state of the art instrumentation this book helps to remedy this situation In her outstanding PhD thesis Julia Bodensteiner identifies a new class of post interaction binaries in a short lived phase just briefly after the initially more massive star has been stripped of part of its envelope She further provides new evidence for the Be phenomenon to largely result from binary interactions These results represented a new and testable prediction for the evolution of these stars and opened up a new way forward for identifying hundreds of post interaction products Finally using the MUSE integral field spectrograph at the Very Large Telescope in Chile the author presents a novel spectroscopic campaign focusing on the 40 Myr old star cluster NGC 330 in the Small Magellanic Clouds Combined with photometric observations from the Hubble Space Telescope the MUSE data allow to characterize the entire massive star population of NGC 330 revealing their multiplicity properties and rotational velocities and providing unique observational constraints on their binary evolution history This is made possible by the developments of novel numerical methods allowing to extract star spectra from the MUSE integral field spectroscopic data and to characterize their properties by the simultaneous comparison of MUSE spectroscopy and Hubble photometry with atmospheric models This book is a partly re
