Very High Angular Resolution Imaging:

Very High Angular Resolution Imaging J.G. Robertson, W.J. Tango, 2013-12-01 The 1990s are proving to be a very exciting period for high angular resolution astronomy. At radio wavelengths a combination of new array instruments and powerful imaging algorithms have generated images of unprecedented resolution and quality. In the optical and infrared the great technical difficulties associated with constructing separated aperture interferometers have been largely overcome and many new instruments are now operating or are being developed. As these programs start to produce observational results they will be able to draw extensively on the experience gained by the radio interferometry community. Thus it seemed that the time was ripe for a meeting which would bring together workers from all wavelength ranges to discuss the details of the science and art of Very High Angular Resolution Imaging. While the main emphasis of Symposium No 158 was on high resolution techniques from the radio mm wave infrared and optical bands it also provided an opportunity for presentation of astronomical results from these techniques. As well as giving our colleagues from the Northern Hemisphere a break from midwinter the location of the Symposium in Australia recognised the continuing development of astronomical interferometry in this country especially the recent completion of the Australia Telescope radio array and the progress toward commissioning of the Sydney University Stellar Interferometer. A number of the participants visited these instruments during the post symposium tour.

Astronomy at High Angular Resolution Henri M. J. Boffin, Gaiete Hussain, Jean-Philippe Berger, Linda Schmidtbreick, 2016-08-24 This book offers an essential compendium of astronomical high resolution techniques. Recent years have seen considerable developments in such techniques which are critical to advances in many areas of astronomy. As reflected in the book these techniques can be divided into direct methods interferometry and reconstruction methods and can be applied to a huge variety of astrophysical systems ranging from planets single stars and binaries to active galactic nuclei providing angular resolution in the micro to tens of milliarcsecond scales. Written by experts in their fields the chapters cover adaptive optics aperture masking imaging spectra disentangling interferometry lucky imaging Roche tomography imaging with interferometry interferometry of AGN AGN reverberation mapping Doppler and magnetic imaging of stellar surfaces

Doppler tomography eclipse mapping Stokes imaging and stellar tomography This book is intended to enable a next generation of astronomers to apply high resolution techniques It informs readers on how to achieve the best angular resolution in the visible and near infrared regimes from diffraction limited to micro arcsecond scales ESO Conference on Very Large Telescopes and Their Instrumentation, Garching, 21-24 March 1988 M. Lagrange,Denis Mourard,Pierre Léna,2012-12-06 Over the last decade many efforts have been made to develop high angular resolution techniques in astrophysics Combined with imaging facilities they have rapidly proved their efficiency and have already led to major astrophysical results During the decade to come astronomers will be offered new even more sophisticated high angular resolution tools especially in the IR and optical domains coupled with much bigger telescopes either on the ground or in space In such a context of rapidly evolving techniques and a growing need for higher angular resolution to test theories or discover new objects the present book reviews both instrumental and scientific aspects The main questions addressed are what kind of science will benefit from high angular resolution techniques How can they best be used Audience The book is accessible to students and research workers in both instrumental and astrophysical aspects *Very Large Telescopes, Their Instrumentation and Programs* M. underlying isotropic single fiber and multiple fiber distributions Next we develop a linear robust and analytical QBI solution using the spherical harmonic basis which is used in a new statistical region based active contour algorithm to segment important white matter fiber bundles In addition we develop a new spherical deconvolution sharpening method that transforms the diffusion q ball ODF into a fiber ODF Finally we propose a new deterministic tractography algorithm and a new probabilistic tractography algorithm exploiting the full distribution of the fiber ODF Overall we show local reconstruction segmentation and tracking results on complex fiber regions with known fiber crossing on simulated HARDI data on a biological phantom and on multiple human brain datasets Most current DTI based methods neglect these complex fibers which might lead to wrong interpretations of the brain anatomy and functioning
