Optimization Theory and Related Topics
Simeon Reich, Alexander J. Zaslavski, 2012 This volume contains the proceedings of the workshop on Optimization Theory and Related Topics held in memory of Dan Butnariu from January 11-14, 2010 in Haifa, Israel. An active researcher in various fields of applied mathematics, Butnariu published over 80 papers. His extensive bibliography is included in this volume. The articles in this volume cover many different areas of Optimization Theory and its applications: maximal monotone operators, sensitivity estimates via Lyapunov functions, inverse Newton transforms, infinite horizon Pontryagin principles, singular optimal control problems with state delays, descent methods for mixed variational inequalities, games on MV algebras, ergodic convergence in subgradient optimization, applications to economics and technology planning, the exact penalty property in constrained optimization, nonsmooth inverse problems, Bregman distances, retraction methods in Banach spaces, and iterative methods for solving equilibrium problems. This volume will be of interest to both graduate students and research mathematicians.

Second-Order Variational Analysis in Optimization, Variational Stability, and Control Boris S. Mordukhovich, 2024-05-21
This fundamental work is a sequel to monographs by the same author: *Variational Analysis and Applications* (2018) and the two Grundlehren volumes *Variational Analysis and Generalized Differentiation I: Basic Theory* (2006) and *II: Applications* (2006). This present book is the first entirely devoted to second-order variational analysis with numerical algorithms and applications to practical models. It covers a wide range of topics, including theoretical, numerical, and implementations that will interest researchers in analysis, applied mathematics, mathematical economics, engineering, and optimization. Inclusion of a variety of exercises and commentaries in each chapter allows the book to be used effectively in a course on this subject. This area has been well recognized as an important and rapidly developing area of nonlinear analysis and optimization with numerous applications. Consisting of 9 interrelated chapters, the book is self-contained, with the inclusion of some preliminaries in Chapter 1. Results presented are useful tools for characterizations of fundamental notions of variational stability of solutions for diverse classes of problems in optimization and optimal control; the study of variational convexity of extended real-valued functions and their specifications and variational sufficiency in optimization; explicit calculations and important applications of second-order subdifferentials associated with the achieved characterizations of variational stability and related concepts to the design and justification of second-order numerical algorithms for solving various classes of optimization problems; nonsmooth equations and subgradient systems are included. Generalized Newtonian algorithms are presented that show local and global convergence with linear, superlinear, and quadratic convergence rates. Algorithms are implemented to address interesting practical problems from the fields of machine learning, statistics, imaging, and other areas.

The Random-Cluster Model
Geoffrey R. Grimmett, 2006-12-13 The random cluster model has emerged as a key tool in the mathematical study of ferromagnetism. It may be viewed as an extension of percolation to include Ising and Potts models, and its analysis is a mix of

arguments from probability and geometry The Random Cluster Model contains accounts of the subcritical and supercritical phases together with clear statements of important open problems The book includes treatment of the first order discontinuous phase transition
