Enterprise Service Oriented Architectures James McGovern, Oliver Sims, Ashish Jain, Mark Little, 2006-07-10 Conventional wisdom of the software stack approach to building applications may no longer be relevant Enterprises are pursuing new ways of organizing systems and processes to become service oriented and event driven Leveraging existing infrastructural investments is a critical aspect to the success of companies both large and small Enterprises have to adapt their systems to support frequent technological changes mergers and acquisitions Furthermore in a growing global market these systems are being called upon to be used by external business partners Technology is often difficult costly and complex and without modern approaches can prevent the enterprise from becoming agile Enterprise Service Oriented Architectures helps readers solve this challenge in making different applications communicate in a loosely coupled manner This classic handbook leverages the experiences of thought leaders functioning in multiple industry verticals and provides a wealth of knowledge for creating the agile enterprise In this book you will learn How to balance the delivery of immediate business value while creating long term strategic capability Fundamental principles of a service oriented architecture find bind and execute The four aspects of SOA Production Consumption Management and Provisioning How to recognize critical success factors to implementing enterprise SOAs Architectural importance of service registries interfaces and contracts Why improper service decomposition can hurt you later rather than sooner How application design and integration practices change as architects seek to implement the agile enterprise About the Authors James McGovern is an enterprise architect for The Hartford He is an industry thought leader and co author of the bestselling book A Practical Guide to Enterprise Architecture Oliver Sims is a recognized leader in the architecture design and implementation of service oriented and component based enterprise systems He was a founding member of the OMG Architecture Board He was co author of the groundbreaking book Business Component Factory Ashish Jain is a Principal Architect with Ping Identity Corporation a leading provider of solutions for identity federation Prior to joining Ping Identity he worked with BEA Systems where his role was to assist BEA customers in designing and implementing their e business strategies using solutions based on J2EE He holds several industry certifications from SUN and BEA and is also a board member for the Denver BEA User group Mark Little is Director of Standards and SOA Manager for JBoss Inc Prior to this he was Chief Architect for Arjuna Technologies Ltd and a Distinguished Engineer at Hewlett Packard As well as being an active member of the OMG JCP OASIS and W3C he is an author on many SOA and Web Services standards He also

Commercial Information Technology grade Sehr gut Technical University of Berlin Fakultät IV Elektrotechnik und Informatik language English abstract The last two decades have shown a major shift from stand alone to networked information technology IT systems Consequently the effective and efficient achievement of interoperability is a key factor to enable seamless business process chains and networks across intra and inter organizational boundaries Thereby interoperability can be understood along three dimensions technical semantic and organizational interoperability While the concept of service oriented architectures SOA and widely accepted Web service standards have benefited technical interoperability in recent years substantially managing and integrating semantic differences in heterogeneous distributed environments remains critical and cost intensive In order to preserve the precise meaning as data is moved from one IT system to another explicit formal information models in terms of ontologies have evolved as the concept of choice from academia to first industry adoption However it has been recognized that the dominant approach of developing a common globally shared ontology as an information model standard has turned out to be limited in real world cross domain environments Organizational boundaries with regard to consensus degree and the complexity deriving from inherent domain specific differences in requirements force a coexistence of independently managed but however semantic interoperable information models In order to address this challenge the guiding idea of this work is to transfer the principle of loose coupling to the semantic level In particular the goal of this thesis is to contribute to the reduction of complexity in semantic system integration by developing an effective and efficient approach for semantic interoperability in large scale SOA landscapes based on semantic mediation between loosely coupled information models Moreover this work shows how emerging semantic technologies can contribute to the instantiation of this concept exploiting their capabilities to explicitly express semantics The developed approach is evaluated based on a case study of an exemplary distributed organization It is shown how the approach of semantic mediation between loosely coupled information models can be applied in practice and which benefits can be generated with regard to achieving effective and efficient semantic interoperability in large scale SOA landscapes *Succeeding with SOA* Paul C. Brown, 2007 *Succeeding with SOA* presents service oriented architecture SOA from the management perspective and illustrates what can happen to enterprise business processes and projects when the elements of the total architecture are neglected
