

# DROUGHT TOLERANT GRASS SEED

THAT USES UP TO 40% LESS WATER\*

\*Products with the TWCA logo can save up to 40% (TURFSEED) less water than products of otherwise single species water drought stress than as measured by percent green cover during drought conditions. This claim does not constitute a guarantee. All TWCA qualified grasses have gone through years of rigorous testing and demonstrated a statistically significant water saving advantage when maintaining acceptable turf quality.

## **Turfgrass Water Conservation:**

**Turfgrass Water Conservation** Stephen T. Cockerham, Bernd Leinauer, 2011-01-01 Water is an increasingly valuable and limited resource often perceived as being wasted on turfgrass. This much anticipated second edition brings clear current science based information on turfgrass management and water conservation to turf managers and researchers alike. Inside you'll find a look at the current understanding of water use as well as new technologies being researched to reduce water use by turfgrass. Attention is paid to water quality and turfgrass as a key part of the urban environment how integrating turfgrass with other landscape uses of water can be part of a conservation plan and how various water qualities including reclaimed water can be part of a management plan. Chapters also cover advances in drought heat and salinity stress tolerance the role of water in modified root zone media and native soils water management technologies considerations for construction and management of urban green spaces including parks and golf courses water depletion pesticide and nutrient runoff. A chapter summarizing the practical application of the science in each chapter rounds out the text presenting the information in an immediately useable format. Includes 10 tables and figures 20 color photos a U S customary to metric conversion table and an 8 page glossary.

**Water Conservation Practices for Irrigation of Turfgrass Lawns** Daniel S. Sandor, 2018 Turfgrass lawns are widely used in residential and commercial landscapes providing many environmental aesthetic and recreational benefits. However concerns and scrutiny arise with perceived maintenance requirements particularly with regards to irrigation. It is important to manage irrigation in order to maximize water conservation without significantly reducing lawn quality. A series of field and greenhouse studies were conducted to investigate how water usage might be reduced in irrigation practices with the following proposed objectives: 1 evaluate the use of rain and soil moisture sensors in a humid transition zone environment 2 evaluate the effects of chronic drought stress between drought resistant and drought sensitive varieties of tall fescue *Festuca arundinacea* Schreb TF and Kentucky bluegrass *Poa pratensis* L KBG under field conditions 3 investigate field performance differences between KBG varieties varying in drought resistance under variable amounts of deficit irrigation 4 evaluate the impact of irrigation frequency on the establishment of seeded cool season turfgrasses varying in drought resistance 5 and evaluate the impact of deficit irrigation for establishing seeded TF cultivars varying in drought resistance in the field. On average rain sensors reduced irrigation by 22.5% and soil moisture sensors reduced irrigation by 66.5% with no decline in turfgrass quality with no decline in lawn quality. Environmental conditions greatly influenced the impact of chronic drought stress on TF and KBG as intense and timely rains occurred. As a result minimal differences in turfgrass quality or green turfgrass coverage were observed. Under prolonged chronic drought stress drought resistant KBG exhibited greater coverage than

drought sensitive KBG at lower levels of deficit irrigation During establishment drought resistant perennial ryegrass *Lolium perenne* L TF and KBG varieties irrigated every two days exhibited similar turfgrass coverage to when irrigated daily Intraspecific drought resistance differences of mature TF and KBG in previous findings were not consistently observed during establishment Tall fescue irrigated at 75% of reference evapotranspiration exhibited similar coverage as irrigation replacing 100% reference evapotranspiration which could be a useful guideline regarding irrigation requirements for establishing TF from seed Overall these findings demonstrate the great potential to reduce water use in irrigation practices used in establishing and maintaining turfgrass lawns

**Determining Water Requirements in Turfgrass Systems** Tyler Quinn Carr, 2019 Turfgrass lawns are commonly utilized for home and commercial applications because of the aesthetic environmental and recreational benefits grasses provide but many people perceive turfgrass as solely an aesthetic benefit that requires significant water inputs It is important to identify and use turfgrass cultivars that have known drought tolerance and also fine tune and throughout development A series of field experiments were conducted to determine the water requirements of turfgrass lawn systems with the following objectives 1 investigate differences in chronic drought resistance and irrigation recommendations among cultivars of Kentucky bluegrass *Poa pratensis* L and tall fescue *Festuca arundinacea* Schreb 2 determine the water use of Kentucky bluegrass as affected by cultivar irrigation frequency and soil texture 3 and determine the reference evapotranspiration ETo percent replacement that maximizes bermudagrass *Cynodon dactylon* L Pers establishment from seed and whether Turfgrass Water Conservation Alliance qualified cultivars require less water to establish from seed From the cultivars evaluated PST K13 137 and NAI 13 132 Kentucky bluegrasses were the most drought tolerant and drought susceptible cultivars respectively and the tall fescue cultivar Thunderstruck was the most drought tolerant and Titanium 2LS was the most drought susceptible For both species there were no significant differences in cumulative water requirements likely be due to the lack of inclusion of experimental controls with known drought tolerance Lysimeters plots irrigated to replace 40% ETo and containing loamy sand resulted in less green turfgrass coverage than those grown in silt loam Water use was significantly affected by soil texture only during late summer 2018 with lysimeters containing silt loam and loamy sand using 23.8 and 22.5 mm per week respectively These results imply that under prolonged drought stress soil texture has minimal effect on water consumption Irrigating to replace 100% ETo is adequate to maximize bermudagrass establishment from seed These conclusions validate the global water saving potential when drought tolerant cultivars and precise irrigation recommendations are implemented
