

WORK & SIMPLE MACHINES

WORK
Work is the transfer of energy through motion. Work is done when an object is moved with the help of force. The object moves in the direction of the applied force. In order for work to take place, a force must be exerted through a distance.

CROWBAR
A machine is something that makes it easier for us to do work, such as moving objects. Thousands of years ago, people did everything using only their own or their animals' muscle power. Later, they invented machines to help make work with less muscle effort and with greater speed.

The crowbar, a first class lever, has the fulcrum between the effort and the load.

LEVER
A lever is a simple machine consisting of a rigid bar pivoted at a point that moves around a fulcrum. A lever uses a force to make the load move. There are different types of levers, which are classified into 3 separate types.

Class 1 - This is where the fulcrum is between the load and the effort. The seesaw, a class 1 lever has the fulcrum between the effort and the load.

SIMPLE MACHINES
Simple machines help us make better use of our muscle power to do work. They help us lift, pull or raise items, change the direction of the force, increase the force, split things, fasten things, and cut things.

TYPES OF SIMPLE MACHINES
People have been using simple machines like wheelbarrow, hammer or scissors for thousands of years. There are six types of simple machines.

Class 2 - This is where the fulcrum is at one end of the lever, the effort is at the other end, and the load is in between. A person and a stapler, examples of class 2 levers, put the load between the effort and the fulcrum.

Class 3 - This is where the fulcrum is at one end of the lever, the load is at the other end, and the effort is in between. A cricket bat, a tennis racket or a hockey stick that hit a ball, have the effort between the fulcrum and the load.

INCLINED PLANE
The inclined plane is a slanting surface used to raise heavy loads to heights using much smaller forces. It requires much less force than needed to lift the load straight up.

WEDGE
A wedge is a form of an inclined plane which can increase force. With a wedge, the material remains in place while the wedge moves through it. Wedges can be used to split, cut or fasten. Axe head, log splitter, knife, nails, chisel, screwdriver, etc. are examples of wedges.

PULLEY
A pulley is a grooved wheel that turns around an axle, and a rope or a chain is used in the groove to lift heavy objects. As you pull down on one end of the rope, the other end rises and lifts whatever is attached to it.

SCREW
A screw is a type of inclined plane that is wrapped around a central post. It works like a spiral staircase and can be used for fastening or closing items like lids on jars, etc.

Archimedes' screw was an early device used for pumping water from rivers or lakes. This machine was built to draw up water using a screw. It was invented by Archimedes in Greece about 2,000 years ago.

WHEEL AND AXLE
The wheel and axle is one of the most important inventions in history. It is the wheel connected to a rigid pole. The wheel and axle is basically a modified lever. The center wheel and axle is basically a modified lever. The center wheel and axle is basically a modified lever. The center wheel and axle is basically a modified lever.

of the axle serves as a fulcrum - making the wheel a lever that rotates around it. Knobs, water faucets, handle bars on a bike, wheels on a car, etc. are examples of a wheel and axle.

GEARS
Gears are type of wheel that have teeth. They are used to change speed. When one gear turns it also turns the other gear. The drive wheel can make a smaller wheel turn faster, or a larger wheel turn slower.

PRINCIPLES OF MACHINE
A machine produces force, controls its motion and direction. A machine cannot create energy. Energy has to be supplied to the machine as fuel, etc. A machine cannot do more work than the energy supplied to it. In other words output is input. Machines transform all kinds of energy into mechanical energy.
