Spatial Orientation Herbert Pick, 2012-12-06 How do people know where in the world they are How do they find their way about These are the sort of questions about spatial orientation with which this book is concerned Staying spatially oriented is a pervasive aspect of all behavior Animals must find their way through their environment searching efficiently for food and returning to their home areas and many species have developed very sophisticated sensing apparatus for helping them do this Even little children know their way around quite complex environments They remember where they put things and are able to retrieve them with little trouble Adults in societies across the world have developed complex navigational systems for helping them find their way over long distances with few distinctive landmarks People across the world use their languages to communicate about spatial orientation in problems of simple direction giving and spatial descriptions as well as problems of long range navigation HUMAN SPATIALLY ORIENTED BEHAVIOR. Sanford J. Freedman, TUFTS UNIV MEDFORD MASS NEUROPSYCHOLOGY LAB., 1969 Studies of the disruption and relearning of sensorimotor relationships were completed and a theoretical position formulated

1 Transformations created by perceptual rearrangement and disarrangement experiments change relationships between two or more kinds of spatial information which are normally congruent or concordant 2 To execute accurate spatially oriented behavior under transformed conditions the observer must solve the problem of defining the transformation a an adequate amount of relevant information must be available to him and he must be able to assimilate it b information may be supplied through any sensory channel or combination or may derive from memory or cognition c he may be unsuccessful or only partially successful 3 The problem is solved by inserting into the sensorimotor system a constant which compensates for the experimental transformation This approach is generally applicable and confers the power of prediction and control whereas other theories which have been proposed do not meet these tests Author *Spatially Oriented Behavior* A. same mode as simple ones How rigidly organized are coordinated actions like orienting or grasping Where do visual feedback signals arise The author s work takes into account the growing acceptance of the idea that movements are not directly dependent upon sensory events but that they are governed by internal representations which are built according to specific experimentally accessible rules Advances in Behavioral Biology ,1971
