Fatigue Analysis of Welded Components E. Niemi, W Fricke, S J Maddox, 2006-09-27 This report provides background and guidance on the use of the structural hot spot stress approach to the fatigue design of welded components and structures It complements the IIW recommendations for Fatigue Design of Welded Joints and Components and extends the information provided in the IIW recommendations on Stress Determination for Fatigue Analysis of Welded Components This approach is applicable to cases of potential fatigue cracking from the weld toe It has been in use for many years in the context of tubular joints The present report concentrates on its extension to structures fabricated from plates and non tubular sections Following an explanation of the structural hot spot stress its definition and its relevance to fatigue the authors describe methods for its determination Stress determination from both finite element analysis and strain gauge measurements is considered Parametric formulae for calculating stress increases due to misalignment and structural discontinuities are also presented Special attention is paid to the use of finite element stress analysis and guidance is given on the choice of element type and size for use with either solid or shell elements Design S N curves for use with the structural hot spot stress are presented for a range of weld details Finally practical application of the recommendations is illustrated in two case studies involving the fatigue assessment of welded structures using the structural hot spot stress approach Provides practical guidance on the application of the structural hot spot stress approach Discusses stress determination from both finite element analysis and strain gauge measurements Practical application of the recommendations is illustrated in two case studies

Axonopathy in Neurodegenerative Disease Samuel D. Crish,Robert W. Burgess,Denise M. Inman,Christine M. Dengler-Crish,Jason R. Richardson,Brett Schofield,2019-02-05 Axons are the major output processes of neurons responsible for transmitting information to other neurons and tissues throughout the body The 150 000 kilometers of axons make up half of the brain s volume and require a large amount of energy Normal axon function is the product of a massive number of intra and extra cellular mechanisms working in concert Perhaps not surprisingly the axon is a site of vulnerability during normal aging and in disease states although this has only been recently appreciated Axonopathy broadly defined as functional or structural defects in the axon or its terminal is common across a wide range of neurodegenerative conditions including amyotrophic lateral sclerosis Huntington s Parkinson s and Alzheimer s diseases glaucoma and as a result of neurotoxin exposure or drug treatment This Research Topic assembles a series of original

research papers reviews and commentaries that will illustrate both the commonalities and important differences across neurodegenerative disorders Though this collection cannot address all aspects of this topic it is our hope that these manuscripts will educate other scientists and inspire new investigations into axon dysfunction and degeneration
