in Modern Astronomy V Eric D. Feigelson, Jogesh Babu, 2012-08-15 This volume contains a selection of chapters based on papers to be presented at the Fifth Statistical Challenges in Modern Astronomy Symposium The symposium will be held June 13-15th at Penn State University Modern astronomical research faces a vast range of statistical issues which have spawned a revival in methodological activity among astronomers The Statistical Challenges in Modern Astronomy V conference will bring astronomers and statisticians together to discuss methodological issues of common interest Time series analysis image analysis Bayesian methods Poisson processes nonlinear regression maximum likelihood multivariate classification and wavelet and multiscale analyses are all important themes to be covered in detail Many problems will be introduced at the conference in the context of large scale astronomical projects including LIGO AXAF XTE Hipparcos and digitized sky surveys

Astrostatistics Gutti Jogesh Babu, E.D. Feigelson, 1996-08-01 Modern astronomers encounter a vast range of challenging statistical problems yet few are familiar with the wealth of techniques developed by statisticians Conversely few statisticians deal with the compelling problems confronted in astronomy Astrostatistics bridges this gap Authored by a statistician astronomer team it provides professionals and advanced students in both fields with exposure to issues of mutual interest In the first half of the book the authors introduce statisticians to stellar galactic and cosmological astronomy and discuss the complex character of astronomical data For astronomers they introduce the statistical principles of nonparametrics multivariate analysis time series analysis density estimation and resampling methods The second half of the book is organized by statistical topic Each chapter contains examples of problems encountered in astronomical research and highlights methodological issues The final chapter explores some controversial issues in astronomy that have a strong statistical component The authors provide an extensive bibliography and references to software for implementing statistical methods The marriage of astronomy and statistics is a natural one and benefits both disciplines Astronomers need the tools and methods of statistics to interpret the vast amount of data they generate and the issues related to astronomical data pose intriguing challenges for statisticians Astrostatistics paves the way to improved statistical analysis of astronomical data and provides a common ground for future collaboration between the two fields *Statistical Challenges in Modern Astronomy*

Eric D. Feigelson, G. Jogesh Babu, 2012-12-06 Modern astronomy has been characterized by an enormous growth in data acquisition from new technologies in telescopes detectors and computation One can now compile catalogs of tens or hundreds of millions of stars or galaxies and databases from satellite based observations are reaching terabit proportions This wealth of data gives rise to statistical challenges not previously encountered in astronomy This book is the result of a workshop held at Pennsylvania State University in August 1991 that brought together leading astronomers and statisticians to consider statistical challenges encountered in modern astronomical research The chapters have all been thoroughly revised in the light of the discussions at the conference and some of the lively discussion is recorded here as well

Statistical Methods for Astronomical Data Analysis Asis Kumar Chattopadhyay, Tanuka Chattopadhyay, 2014-10-01

This book introduces Astrostatistics as a subject in its own right with rewarding examples including work by the authors with galaxy and Gamma Ray Burst data to engage the reader This includes a comprehensive blending of Astrophysics and Statistics The first chapter s coverage of preliminary concepts and terminologies for astronomical phenomenon will appeal to both Statistics and Astrophysics readers as helpful context Statistics concepts covered in the book provide a methodological framework A unique feature is the inclusion of different possible sources of astronomical data as well as software packages for converting the raw data into appropriate forms for data analysis Readers can then use the appropriate statistical packages for their particular data analysis needs The ideas of statistical inference discussed in the book help readers determine how to apply statistical tests The authors cover different applications of statistical techniques already developed or specifically introduced for astronomical problems including regression techniques along with their usefulness for data set problems related to size and dimension Analysis of missing data is an important part of the book because of its significance for work with astronomical data Both existing and new techniques related to dimension reduction and clustering are illustrated through examples There is detailed coverage of applications useful for classification discrimination data mining and time series analysis Later chapters explain simulation techniques useful for the development of physical models where it is difficult or impossible to collect data Finally coverage of the many R programs for techniques discussed makes this book a fantastic practical reference Readers may apply what they learn directly to their data sets in addition to the data sets included by the authors

Statistical Challenges in Modern Astronomy II G. Jogesh Babu, Eric D. Feigelson, 2012-12-06 Modern astronomical research faces a vast range of statistical issues which have spawned a revival in methodological activity among astronomers The Statistical Challenges in Modern Astronomy II conference held in June 1996 at the Pennsylvania State University five years after the first conference brought astronomers and statisticians together to discuss

methodological issues of common interest Time series analysis image analysis Bayesian methods Poisson processes nonlinear regression maximum likelihood multivariate classification and wavelet and multiscale analyses were important themes Astronomers frequently encounter troublesome situations such as heteroscedastic weighting of data unevenly spaced time series and selection effects leading to censoring and truncation Many problems were introduced at the conference in the context of large scale astronomical projects including LIGO AXAF XTE Hipparcos and digitized sky surveys This volume will be of interest to researchers and advanced students in both fields astronomers who seek exposure to recent developments in statistics and statisticians interested in confronting new problems It is edited by two faculty members of the Pennsylvania State University who have a long standing cross disciplinary collaboration and jointly authored the recent introductory monograph *Astrostatistics* G J Babu is Professor of Statistics Fellow of the Institute of Mathematical Statistics and Associate Editor of the Journal of Statistical Planning Inference and the Journal of Nonparametric Statistics Eric D Feigelson is Professor of Astronomy and Astrophysics

Feigelson, 2007 This is the fourth in a series of international conferences for the vanguard of researchers in the cross disciplinary field of astrostatistics Both astronomical and statistical communities now recognize the wide array of fascinating methodological issues faced by the modern astronomer Ranging from terabyte wide field surveys to small N samples from cosmology to the search for Earth like planets astronomical research can no longer be pursued with a small toolbox of familiar statistical methods Over thirty distinguished scholars from both fields presented invited talks and commentaries on leading problems in astrostatistics The methodological challenges of inferring cosmological insights from the cosmic microwave background fluctuations the distribution of galaxies in space gravitational lensing and galaxy structure we describe in detail Time series analysis is discussed in a variety of contexts sparse Poisson data multiply periodic systems

gravitational wave detection and most dramatically in the search for extrasolar planets Here sophisticated Bayesian model selection with MCMC computations plays a critical role Other topics covered include image processing analysis of mega datasets from large surveys and small N problems in both astronomy and particle physics The volume ends with cross disciplinary overviews and software tutorials The book will be valuable to graduate students and researchers in both astronomy and statistics who seek insights into this promising avenue of cross disciplinary research Publisher s website
