Topics In Classical Automorphic Forms:

Topics in Classical Automorphic Forms Henryk Iwaniec, 1997 This book is based on the notes from the graduate course given by the author at Rutgers University in the fall of 1994 and the spring of 1995 The main goal of the book is to acquaint the reader with various perspectives of the theory of automorphic forms In addition to detailed and often nonstandard exposition of familiar topics of the theory particular attention is paid to such subjects as theta functions and representations by quadratic forms

Topics in Classical Automorphic Forms Henryk Iwaniec, 1997 The main purpose of the book is to present the reader with various perspectives of the theory of automorphic forms In addition to detailed and often nonstandard exposition of familiar topics of the theory with a particular emphasis on analytic aspects special attention is paid to such subjects as theta functions and representations of integers by quadratic forms

Spectral Methods of Automorphic Forms Henryk Iwaniec, 2002 Automorphic forms are one of the central topics of analytic number theory In fact they sit at the confluence of analysis algebra geometry and number theory In this book Henryk Iwaniec once again displays his penetrating insight powerful analytic techniques and lucid writing style The first edition of this volume was an underground classic both as a textbook and as a respected source for results ideas and references The book's reputation sparked a growing interest in the mathematical community to bring it back into print The AMS has answered that call with the publication of this second edition In the book Iwaniec treats the spectral theory of automorphic forms as the study of the space $L^2(H/\Gamma)$ where H is the upper half plane and Γ is a discrete subgroup of volume preserving transformations of H He combines various techniques from analytic number theory Among the topics discussed are Eisenstein series estimates for Fourier coefficients of automorphic forms the theory of Kloosterman sums the Selberg trace formula and the theory of small eigenvalues Henryk Iwaniec was awarded the 2002 AMS Cole Prize for his fundamental contributions to analytic number theory Also available from the AMS by H Iwaniec is *Topics in Classical Automorphic Forms* Volume 17 in the Graduate Studies in Mathematics series The book is designed for graduate students and researchers working in analytic number theory

Fourier Analysis on Number Fields Dinakar Ramakrishnan, Robert J. Valenza, 2013-04-17 This book grew out of notes from several courses that the first author has taught over the past nine years at the California Institute of Technology and earlier at the Johns Hopkins University Cornell University the University of Chicago and the University of Crete Our general aim is to provide a modern approach to number theory through a blending of complementary algebraic and analytic perspectives emphasizing harmonic analysis on topological groups Our more particular goal is to cover Jolm Tate's visionary thesis giving virtually all of the necessary analytic details and topological preliminaries technical prerequisites that are often foreign to the typical more algebraically inclined number theorist Most of the existing treatments of Tate's thesis including Tate's own range from terse to cryptic our intent is to be more leisurely more comprehensive and more comprehensible To this end we have assembled material that has admittedly been treated elsewhere but not in a single volume with so much detail and not with our

particular focus We address our text to students who have taken a year of graduate level courses in algebra analysis and topology While our choice of objects and methods is naturally guided by the specific mathematical goals of the text our approach is by no means narrow In fact the subject matter at hand is germane not only to budding number theorists but also to students of harmonic analysis or the representation theory of Lie groups

Analytic Number Theory Henryk Iwaniec, Emmanuel Kowalski, 2021-10-14 Analytic Number Theory distinguishes itself by the variety of tools it uses to establish results One of the primary attractions of this theory is its vast diversity of concepts and methods The main goals of this book are to show the scope of the theory both in classical and modern directions and to exhibit its wealth and prospects beautiful theorems and powerful techniques The book is written with graduate students in mind and the authors nicely balance clarity completeness and generality The exercises in each section serve dual purposes some intended to improve readers understanding of the subject and others providing additional information Formal prerequisites for the major part of the book do not go beyond calculus complex analysis integration and Fourier series and integrals In later chapters automorphic forms become important with much of the necessary information about them included in two survey chapters

An Introduction to the Langlands Program Joseph Bernstein, Stephen Gelbart, 2013-12-11 For the past several decades the theory of automorphic forms has become a major focal point of development in number theory and algebraic geometry with applications in many diverse areas including combinatorics and mathematical physics The twelve chapters of this monograph present a broad user friendly introduction to the Langlands program that is the theory of automorphic forms and its connection with the theory of L functions and other fields of mathematics Covered are a variety of areas in number theory from the classical zeta function up to the Langlands program The exposition is systematic with each chapter focusing on a particular topic devoted to special cases of the program and accessible to graduate students and researchers in the field

Traces of Hecke Operators Andrew Knightly, Charles Li, 2006 The Fourier coefficients of modular forms are of widespread interest as an important source of arithmetic information In many cases these coefficients can be recovered from explicit knowledge of the traces of Hecke operators The original trace formula for Hecke operators was given by Selberg in 1956 Many improvements were made in subsequent years notably by Eichler and Hijikata This book provides a comprehensive modern treatment of the Eichler Selberg Hijikata trace formula for the traces of Hecke operators on spaces of holomorphic cusp forms of weight $k \geq 2$ for congruence subgroups of $SL(2, \mathbb{Z})$ The first half of the text brings together the background from number theory and representation theory required for the computation This includes detailed discussions of modular forms Hecke operators adèles and ideles structure theory for $GL(2, \mathbb{A})$ strong approximation integration on locally compact groups the Poisson summation formula adelic zeta functions basic representation theory for locally compact groups the unitary representations of $GL(2, \mathbb{R})$ and the connection between classical cusp forms and their adelic counterparts on $GL(2, \mathbb{A})$ The second half

begins with a full development of the geometric side of the Arthur Selberg trace formula for the group operatorname GL 2
 \mathbf{A} This leads to an expression for the trace of a Hecke operator which is then computed explicitly The exposition is
virtually self contained with complete references for the occasional use of auxiliary results The book concludes with several
applications of the final formula *Automorphic Forms on GL (3, IR)* Daniel Bump, 1984 **Bulletin of the American
Mathematical Society**, 2001 **Hodge Theory, Complex Geometry, and Representation Theory** Mark Green, Phillip
Griffiths, Matt Kerr, 2013-11-05 This monograph presents topics in Hodge theory and representation theory two of the most
active and important areas in contemporary mathematics The underlying theme is the use of complex geometry to
understand the two subjects and their relationships to one another an approach that is complementary to what is in the
literature Finite dimensional representation theory and complex geometry enter via the concept of Hodge representations
and Hodge domains Infinite dimensional representation theory specifically the discrete series and their limits enters through
the realization of these representations through complex geometry as pioneered by Schmid and in the subsequent
description of automorphic cohomology For the latter topic of particular importance is the recent work of Carayol that
potentially introduces a new perspective in arithmetic automorphic representation theory The present work gives a
treatment of Carayol s work and some extensions of it set in a general complex geometric framework Additional subjects
include a description of the relationship between limiting mixed Hodge structures and the boundary orbit structure of Hodge
domains a general treatment of the correspondence spaces that are used to construct Penrose transforms and selected other
topics from the recent literature A co publication of the AMS and CBMS Bulletin (new Series) of the American
