## **Topology Of Closed One Forms:**

Topology of Closed One-Forms Michael Farber, 2014-05-21 Viewed locally a closed one form on a manifold is a smooth function up to an additive constant The global structure of a closed one form is mainly determined by its de Rham cohomology class In this book Michael Farber studies fascinating geometrical topological and dynamical properties of closed one forms In particular he reveals the relations between their global and local features In 1981 S P Novikov initiated a generalization of Morse theory in which instead of critical points of smooth functions one deals with closed one forms and their zeros The first two chapters of the book written in textbook style give a detailed exposition of Novikov theory which now plays a fundamental role in geometry and topology In the following chapters the author describes the universal chain complex that lives over a localization in the sense of P M Cohn of the group ring and relates the topology of the underlying manifold with information about zeros of closed one forms Using this complex many different variations and generalizations of the Novikov inequalities are obtained including Bott type inequalities for closed one forms equivariant inequalities and inequalities i

**Topology of Closed 1-Forms on Manifolds with Boundary** Tieqiang Tan Li, 2009 The topological structure of a manifold can be effectively revealed by studying the critical points of a nice function assigned on it This is the essential motivation of Morse theory and many of its generalisations from a modern viewpoint One fruitful direction of the generalisation of the theory is to look at the zeros of a closed 1 form which can be viewed locally as a real function up to an additive constant initiated by S P Novikov see 32 and 33 Extensive literatures have been devoted to the study of so called Novikov theory on closed manifolds which consists of interesting objects such as Novikov complex Morse Novikov inequalities and Novikov ring On the other hand the topology of a space e g a manifold provides vital information on the number of the critical points of a function Along this line a whole different approach was suggested in the 1930s by Lusternik and Schnirelman 25 and 26 M Farber in 9 10 11 and 12 generalised this concept with respect to a closed 1 form and used it to study the critical points and existence of homoclinic cycles on a closed manifold in much more degenerate settings This thesis combines the two aspects in the context of closed 1 forms and attempts a systematic treatment on smooth compact manifolds with boundary in the sense that the transversality assumptions on the boundary is consistent thoroughly Overall the thesis employs a geometric approach to the generalisation of the existing results

*Integration of One-forms on P-adic Analytic Spaces. (AM-162)* Vladimir G. Berkovich, 2007 Among the many differences between classical and p adic objects those related to differential equations occupy a special place For example a closed p adic analytic one form defined on a simply connected domain does not necessarily have a primitive in the class of analytic functions In the early 1980s Robert Coleman discovered a way to construct primitives of analytic one forms on certain smooth p adic analytic curves in a bigger class of functions Since then there have been several attempts to generalize his ideas to smooth p adic analytic spaces of higher dimension but the spaces considered were invariably associated with algebraic varieties This book aims to show that

every smooth  $p$ -adic analytic space is provided with a sheaf of functions that includes all analytic ones and satisfies a uniqueness property. It also contains local primitives of all closed one-forms with coefficients in the sheaf that in the case considered by Coleman coincide with those he constructed. In consequence, one constructs a parallel transport of local solutions of a unipotent differential equation and an integral of a closed one-form along a path so that both depend nontrivially on the homotopy class of the path. Both the author's previous results on geometric properties of smooth  $p$ -adic analytic spaces and the theory of isocrystals are further developed in this book, which is aimed at graduate students and mathematicians working in the areas of non-Archimedean analytic geometry, number theory, and algebraic geometry.

**Geometry of Foliations** Philippe Tondeur, 1997-05. Surveys research over the past few years at a level accessible to graduate students and researchers with a background in differential and Riemannian geometry. Among the topics are foliations of codimension one, holonomy, Lie foliations, basic forms, mean curvature, the Hodge theory for the transversal Laplacian, applications of the heat equation method to Riemannian foliations, the spectral theory, Connes' perspective of foliations as examples of non-commutative spaces, and infinite-dimensional examples. The bibliographic appendices list books and surveys on particular aspects of foliations, proceedings of conferences and symposia, all papers on the subject up to 1995, and the numbers of papers published on the subject during the years 1990-95. **Ergodic Theory** Cesar E. Silva, Alexandre I. Danilenko, 2023-07-31. This volume in the Encyclopedia of Complexity and Systems Science, Second Edition, covers recent developments in classical areas of ergodic theory, including the asymptotic properties of measurable dynamical systems, spectral theory, entropy, ergodic theorems, joinings, isomorphism theory, recurrence, nonsingular systems. It enlightens connections of ergodic theory with symbolic dynamics, topological dynamics, smooth dynamics, combinatorics, number theory, pressure, and equilibrium states, fractal geometry, chaos. In addition, the new edition includes dynamical systems of probabilistic origin, ergodic aspects of Sarnak's conjecture, translation flows on translation surfaces, complexity, and classification of measurable systems, operator approach to asymptotic properties, interplay with operator algebras.

**Advanced Mathematical Methods in Biosciences and Applications** Faina Berezovskaya, Bourama Toni, 2019-09-19. Featuring contributions from experts in mathematical biology and biomedical research, this edited volume covers a diverse set of topics on mathematical methods and applications in the biosciences. Topics focus on advanced mathematical methods, with chapters on the mathematical analysis of the quasispecies model, Arnold's weak resonance equation, bifurcation analysis, and the Tonnelier-Gerstner model. Special emphasis is placed on applications such as natural selection, population heterogeneity, polyvariant ontogeny in plants, cancer dynamics, and analytical solutions for traveling pulses and wave trains in neural models. A survey on quasiperiodic topology is also presented in this book. Carefully peer-reviewed, this volume is

suitable for students interested in interdisciplinary research Researchers in applied mathematics and the biosciences will find this book an important resource on the latest developments in the field In keeping with the STEAM H series the editors hope to inspire interdisciplinary understanding and collaboration

a canonical biinvariant metric on  $\text{Ham}(M, \omega)$ . Since Hofer's work this new geometry has been intensively studied in the framework of modern symplectic topology. In the present book I will describe some of these developments. Hofer's geometry enables us to study various notions and problems which come from the familiar finite dimensional geometry in the context of the group of Hamiltonian diffeomorphisms. They turn out to be very different from the usual circle of problems considered in symplectic topology and thus extend significantly our vision of the symplectic world.
