Therefore business transactions are multiple basic operations involving exchanges cash credit information that have financial implications such as customer placing an order or someone paying parking tickets and they establish a connection between an organization and its database 3 A TP system is a form of data base management system that processes business transactions 1 Usually there exist several different systems in one organization Examples of TP applications are payroll inventory order processing reservations account processing in banks and stock trading 3 Considering the highly increased volume of transactions processed by organizations due to the credit card revolution and the Internet and their need to process the transactions in a timely fashion there arise several problems and performance constraints to the transaction processing and its systems which need to be addressed To identify a certain performance of a TP system the Input Output I O of a system is a adequate measure In the following it will be assumed that the organizations already provide of Transaction Processing Facilities TPF that Main Memory Database Systems MMDS are not practical that most TP systems are already distributed i e that the organization have implemented a Distributed Database Management System DDMS and finally that the organizations have the fastest available computers networks already installed

**Transaction Processing: Past, Present, and Future** Alex Louwe Kooijmans, Elsie Ramos, Niek De Greef, Dominique Delhumeau, Donna Eng Dillenberger, Hilon Potter, Nigel Williams, IBM Redbooks, 2012-09-29

The role of IT is becoming more prominent in people's daily lives and we are becoming increasingly dependent on computers More and more business transactions are being automated for example ordering a book at an online bookstore or transferring money to a bank account in another part of the world No matter the type of transaction we want it to be accurate and we want to have no doubts about its outcome Transactions are also becoming more complex driven by new ways of conducting business and new technologies Smartphones now allow us to conduct transactions anywhere and at anytime Technology paradigms such as Web 2.0 and business event processing enable businesses to increase the dynamics of a transaction through instrumentation that captures events analyzes the associated data and proactively interacts with the client in order to improve the customer experience To adapt to the increasing volume and complexity of transactions requires an ongoing assessment of the current way of supporting transactions with IT No matter what your business is you need to ensure that your transactions are properly completed with integrity Wrong or incomplete results can adversely affect client loyalty affect company profits and lead to claims lawsuits or fines Companies need to be able to rely on computer systems that are 100% reliable and guarantee transaction integrity at all times The IBM mainframe is such a platform Clients that have been using an IBM mainframe are conscious of its added value For this IBM Redguide™ publication we surveyed a number of companies that use the IBM mainframe and we asked them to tell us its most distinguishing qualities They answered unanimously reliability availability and scalability They also do not see an alternative for running their mission critical business workloads other than the IBM mainframe When we surveyed our clients we also asked them about the future Clearly major future trends demand

significantly smarter faster and bigger transaction processing systems than we have today Some of these trends are the availability of new computing paradigms continuing growth of the mobile channel further integration of organizations massive growth of unstructured and uncertain data and increasing complexity of IT systems IBM continues to invest in mainframe technology leadership which protects years of client investments on this platform Today well known transaction processing TP middleware such as the IBM CICS IBM IMS IBM z TPF and IBM WebSphere Application Server products and also solutions for service oriented architecture SOA and business process management BPM are available and fully optimized on the IBM mainframe running the mission critical business workloads of many companies the world over In 2010 IBM announced the IBM zEnterprise system introducing a hybrid computing platform that combines the traditional IBM mainframe capabilities and the ability to use IBM blade servers managed by a single management software With zEnterprise you can significantly reduce the complexity of your IT and achieve better service levels while continuing to benefit from traditional mainframe strengths in transaction processing
