all areas of technology at all length scales and flow regimes and can involve compressible or incompressible linear or nonlinear fluids However although they are ubiquitous multiphase flows continue to be one of the most challenging areas of computational mechanics with numerous problems as yet unsolved Advanced computational and experimental methods are often required to solve the equations that describe such complex problems The many challenges that must be faced in solving them include modelling nonlinear fluids modelling and tracking interfaces dealing with multiple length scales characterising phase structures and treating drop break up and coalescence It is important to validate models which calls for the use of expensive and difficult experimental techniques This book presents contributions on the latest research in the techniques for solving multiphase flow problems presented at the seventh in a biennial series of conferences on the subject that began in 2001 Featured topics include Flow in porous media Turbulent flow Multiphase flow simulation Image processing Heat transfer Atomization Interface behaviour Oil and gas applications Experimental measurements Energy applications Biological flows Micro and macro fluids Compressible flows
