Stochastic Approximation And Its Applications:

Stochastic Approximation and Its Applications Han-Fu Chen, 2005-12-30 Estimating unknown parameters based on observation data containing information about the parameters is ubiquitous in diverse areas of both theory and application. For example, in system identification the unknown system coefficients are estimated on the basis of input-output data of the control system; in adaptive control systems the adaptive control gain should be defined based on observation data in such a way that the gain asymptotically tends to the optimal one; in blind channel identification the channel coefficients are estimated using the output data obtained at the receiver; in signal processing the optimal weighting matrix is estimated on the basis of observations; in pattern classification the parameters specifying the partition hyperplane are searched by learning, and more examples may be added to this list. All these parameter estimation problems can be transformed to a root-seeking problem for an unknown function. To see this, let note the observation at time i , i.e. the information available about the unknown parameters at time i . It can be assumed that the parameter under estimation denoted by θ is a root of some unknown function. This is not a restriction because, for example, $\theta^T x_i$ may serve as such a function.

Stochastic Approximation and Recursive Algorithms and Applications Harold Kushner, G. George Yin, 2006-05-04 The basic stochastic approximation algorithms introduced by Robbins and Monro and by Kiefer and Wolfowitz in the early 1950s have been the subject of an enormous literature, both theoretical and applied. This is due to the large number of applications and the interesting theoretical issues in the analysis of dynamically defined stochastic processes. The basic paradigm is a stochastic difference equation such as $Y_{n+1} = Y_n + \alpha_n (g(Y_n) + \epsilon_n)$ where Y_n takes values in some Euclidean space, Y_0 is a random variable, and the step size α_n is small and might go to zero as $n \rightarrow \infty$. In its simplest form, Y_n is a parameter of a system and the random vector ϵ_n is a function of n noise-corrupted observations taken on the system when

the parameter is set to One recursively adjusts the parameter so that some goal is met n asymptotically
 This book is concerned with the qualitative and asymptotic properties of such recursive algorithms in the diverse forms in which they arise in applications There are analogous continuous time algorithms but the conditions and proofs are generally very close to those for the discrete time case The original work was motivated by the problem of finding a root of a continuous function g where the function is not known but the experimenter is able to take noisy measurements at any desired value of x
 Recursive methods for root finding are common in classical numerical analysis and it is reasonable to expect that appropriate stochastic analogs would also perform well *Stochastic Approximation and Optimization of Random Systems* L. Stochastic Approximation and Its Application in MCMC Yichen Cheng, 2013 Stochastic

approximation has been widely used since first proposed by Herbert Robbins and Sutton Monro in 1951 It is an iterative stochastic method that attempts to find the zeros of functions that cannot be computed directly In this thesis we used the technique in several different aspects It was used in the analysis of large geostatistical data in the improvement of simulated annealing algorithm also as well as for NMR protein structure determination 1 We proposed a resampling based Stochastic approximation method for the analysis of large geostatistical data The main difficulty that lies in the analysis of geostatistical data is the computation time is extremely long when the sample size becomes large Our proposed method only use a small portion of the data at each iteration Each time we update our estimators based on a randomly selected subset of the data using stochastic approximation In this way we use the information from the whole data set while keep the computation time almost irrelevant to the sample size We proved the consistency of our estimator and showed by simulation study that the computation time is much reduced compared to other existing methods 2 Simulated Annealing algorithm has been widely used for optimization problems However it can not guarantee the global optima to be located unless a logarithmic cooling schedule is used However the logarithm rate is so slow that no one can afford such a long cpu time We proposed a new stochastic optimization algorithm the so called simulated stochastic approximation annealing SAA algorithm which is a combination of simulated annealing and the stochastic approximation Monte Carlo SAMC algorithm It is shown that the new algorithm can work with a cooling schedule that decreases much faster than in the logarithmic cooling schedule while guarantee the global optima to be reached when temperature tends to zero 3 Protein Structure determination is a very important topic in computational biology It aims to determine different conformations for each protein which helps to understand biological functions such as protein protein interactions protein DNA interactions and so on Protein structure determination consists of a series of steps and peak picking is a very important step It is the prerequisite for all other steps Manually pick the peaks is very time consuming To automate this process several methods have been proposed However due to the complexity of NMR spectra the existing method is hard to distinguish false peaks and true peaks perfectly The main difficulty lies in identifying true peaks with low intensity and overlapping peaks We propose to model the spectrum as a mixture of bivariate Gaussian densities and used stochastic approximation Monte Carlo SAMC method as the computational approach to solve this problem Essentially by putting the peak picking problem into a Bayesian framework we turned it into a model selection problem Because Bayesian method will automatically penalize including too much component into the model our model will distinguish true peaks from noises without pre process of the data The electronic version of this dissertation is accessible from <http://hdl.handle.net/1969/1/151016> [Handbook of Monte Carlo Methods](#) Dirk P.
