Timing Neutron Stars:

Timing Neutron Stars H. Ögelman, E.P. van den Heuvel, 2012-12-06 The idea for organizing an Advanced Study Institute devoted largely to neutron star timing arose independently in three places at Istanbul Garching and Amsterdam when we became aware of each other's ideas we decided to join forces The choice of a place for the Institute in Turkey appealed much to us all and it was then quickly decided that Qe me would be an excellent spot When the preparations for the Institute started early in 1987 we could not have guessed how timely the subject actually was Of course the recently discovered QPO phenomena in accreting neutron stars and half a dozen binary and millisecond radio pulsars known at the time formed one of the basic motivations for organizing this Institute But none of us could have guessed that later in 1987 we were to witness the wonderful discovery of the binary and millisecond radio pulsars in globular clusters and as if Nature wished to give us a special present for this the discovery in March 1988 of a millisecond pulsar in an eclipsing binary system the first eclipsing radio pulsar ever found and the second fastest in the sky The discussion of this pulsar its formation and fate was one of the highlights of this meeting especially since its discoverers were among the participants of the Institute and could provide us with first hand information

Timing Neutron Stars: Pulsations, Oscillations and Explosions Tomaso M. Belloni, Mariano Méndez, Chengmin Zhang, 2020-10-23 Neutron stars whether isolated or in a binary system display a varied and complex phenomenology often accompanied by extreme variability of many time scales which takes the form of pulsations due to the object rotation quasi periodicities associated to accretion of matter and explosions due to matter accreted on the surface or to starquakes of highly magnetized objects This book gives an overview of the current observational and theoretical standpoint in the research on the physics under the extreme conditions that neutron stars naturally provide The six chapters explore three physical regions of a neutron star the space around it where accretion and pulsar companions allow testing of general relativity its surface where millisecond pulsation and X ray burts provide clues about general relativistic effects and the equation of state of neutron matter its interior of course inaccessible to direct observations can nevertheless be probed with all observational parameters related to neutron star variability

Alpar, 1998-08-14 The NATO Advanced Study Institute The Many Faces of Neutron Stars was the fourth in a series focusing on the astrophysics of neutron stars which started with the ASI Timing Neutron Stars Qe me Turkey April 1988 and as followed by Neutron Stars and Interdisciplinary Field Agia Pelagia Greece September 1990 and The Lives of the Neutron

Stars Kemer Turkey September 1993 The first ASI had as its theme the main types of observations from which we infer the properties of neutron stars i.e. the timing of radio pulsars and accreting neutron stars in X-ray binaries The second ASI centered on the interplay between various areas of physics and their sometimes exotic applications to the extreme conditions encountered in neutron stars In the third ASI the evolutionary connections that exist between different types of neutron stars provided the theme of the lectures During the last several years the number of neutron stars in their various disguises e.g. millisecond radio pulsars single neutron star X-ray sources and soft gamma-ray repeaters has increased substantially and new phenomena have been discovered in known populations of neutron star systems e.g. the kHz QPO in low mass X-ray binaries For this reason we have selected The Many Faces of Neutron Stars as the theme of this fourth Advanced Study Institute on neutron stars

Timing Neutron Stars. Proceedings of the Advanced NATO Workshop Held in Cesme, Izmir, Turkey. 4-15 April, 1988 H. Ogelman, E.P.J. van den Heuvel, 1989 Neutron Stars Sophia Anderson, AI, 2025-03-06

Neutron stars the subject of the book Neutron Stars are the ultra-dense remnants of massive stars supernova explosions They serve as cosmic laboratories where extreme physics inaccessible on Earth can be observed These fascinating objects offer insights into stellar evolution the creation of elements and fundamental physical laws One intriguing fact is their immense density a teaspoonful of neutron star material would weigh billions of tons Another is the presence of magnetars a subset of neutron stars with the most powerful magnetic fields known in the universe The book explores the properties of neutron stars their formation through supernova events and the influence of their intense magnetic fields It adopts a fact-based approach drawing on observational data from telescopes across the electromagnetic spectrum combined with theoretical models rooted in nuclear physics general relativity and plasma physics Progressing from basic properties to formation mechanisms the text analyzes magnetic fields and observational evidence connecting neutron star research to nuclear and plasma physics as well as gravitational physics These explorations offer applications for understanding nuclear matter and testing general relativity

Colloquium, 2016 One of the primary science goals of the next generation of hard X-ray timing instruments is to determine the equation of state of matter at supranuclear densities inside neutron stars by measuring the radius of neutron stars with different masses to accuracies of a few percent Three main techniques can be used to achieve this goal The first involves waveform modeling The flux observed from a hotspot on the neutron star surface offset from the rotational pole will be modulated by the star's rotation and this periodic modulation at the spin frequency is called a pulsation As the photons propagate through the curved spacetime of the star information about mass and radius is encoded into the shape of the waveform pulse profile via special and general relativistic effects Using pulsations from known sources which have hotspots that develop either during thermo-nuclear bursts or due to channeled accretion it is possible to obtain tight constraints on mass and radius The second technique involves characterizing the spin distribution of accreting neutron stars A large collecting area enables highly sensitive searches for weak or intermittent pulsations which yield spin from the many

accreting neutron stars whose spin rates are not yet known. The most rapidly rotating stars provide a clean constraint since the limiting spin rate where the equatorial surface velocity is comparable to the local orbital velocity at which mass shedding occurs is a function of mass and radius. However, the overall spin distribution also provides a guide to the torque mechanisms in operation and the moment of inertia, both of which can depend sensitively on dense matter physics. The third technique is to search for quasiperiodic oscillations in x-ray flux associated with global seismic vibrations of magnetars, the most highly magnetized neutron stars triggered by magnetic explosions. The vibrational frequencies depend on stellar parameters including the dense matter equation of state and large area x-ray timing instruments would provide much improved detection capability. In addition, an illustration is given of how these complementary x-ray timing techniques can be used to constrain the dense matter equation of state and the results that might be expected from a 10 m² instrument are discussed. Also discussed are how the results from such a facility would compare to other astronomical investigations of neutron star properties.

The Lives of the Neutron Stars M.H. Alpar, Ü. Kizilogamalu, Jan van Paradijs, 2012-10-14. This NATO AS was the third in the series of Advanced Study Institutes on neutron stars which started with Timing Neutron Stars held in Qe me near izmir Turkey April 1988 followed by Neutron Stars an Interdisciplinary Subject held in Agia Pelagia on the island of Crete September 1990. The first school centered on our main observational access to neutron stars i.e. the timing of radio pulsars and accretion powered neutron stars and on what timing of neutron stars teaches us of their structure and environment. The second school had as its theme the interplay between diverse areas of physics which find interesting even exotic applications in the extreme conditions of neutron stars and their magnetospheres. As the field has developed with the number of observed neutron stars rapidly increasing and our knowledge of many individual neutron stars getting deeper and more detailed, an evolutionary picture of neutron stars has started to emerge. This led us to choose The Lives of the Neutron Stars as the unifying theme of this third Advanced Study Institute on neutron stars. Different types of neutron star activity have been proposed to follow one another in stages during the lives of neutron stars in the same basic population; the evolutionary connection between low mass X-ray binaries and millisecond radio pulsars is perhaps the prime example.
