Topics In Number Theory Minking Eie, 2008-12-22 This is a first ever textbook written in English about the theory of modular forms and Jacobi forms of several variables It contains the classical theory as well as a new theory on Jacobi forms over Cayley numbers

developed by the author from 1990 to 2000 Applications to the classical Euler sums are of special interest to those who are eager to evaluate double Euler sums or more general multiple zeta values The celebrated sum formula proved by Granville in 1997 is given in a more general form here *Introduction to Modern Number Theory* Yu. I. Manin, Alexei A. Panchishkin, 2006-03-30 This edition has been called startlingly up to date and in this corrected second printing you can be sure that it is even more contemporaneous It surveys from a unified point of view both the modern state and the trends of continuing development in various branches of number theory Illuminated by elementary problems the central ideas of modern theories are laid bare Some topics covered include non Abelian generalizations of class field theory recursive computability and Diophantine equations zeta and L functions This substantially revised and expanded new edition contains several new sections such as Wiles proof of Fermat's Last Theorem and relevant techniques coming from a synthesis of various theories

Topics in Number Theory J.S. Chahal, 1988-06-30 This book reproduces with minor changes the notes prepared for a course given at Brigham Young University during the academic year 1984-1985 It is intended to be an introduction to the theory of numbers The audience consisted largely of undergraduate students with no more background than high school mathematics The presentation was thus kept as elementary and self contained as possible However because the discussion was generally carried far enough to introduce the audience to some areas of current research the book should also be useful to graduate students The only prerequisite to reading the book is an interest in and aptitude for mathematics Though the topics may seem unrelated the study of diophantine equations has been our main goal I am indebted to several mathematicians whose published as well as unpublished work has been freely used throughout this book In particular the Phillips Lectures at Haverford College given by Professor John T Tate have been an important source of material for the book Some parts of Chapter 5 on algebraic curves are for example based on these lectures
