Texture Analysis In Machine Vision:

Texture Analysis in Machine Vision Matti Pietikäinen, 2000
Texture analysis is an important generic research area of machine vision. The potential areas of application include biomedical image analysis, industrial inspection, analysis of satellite or aerial imagery, content based retrieval from image databases, document analysis, biometric person authentication, scene analysis for robot navigation, texture synthesis for computer graphics and animation, and image coding. Texture analysis has been a topic of intensive research for over three decades, but the progress has been very slow. A workshop on Texture Analysis in Machine Vision was held at the University of Oulu, Finland, in 1999, providing a forum for presenting recent research results and for discussing how to make progress in order to increase the usefulness of texture in practical applications. This book contains extended and revised versions of the papers presented at the workshop. The first part of the book deals with texture analysis methodology, while the second part covers various applications. The book gives a unique view of different approaches and applications of texture analysis. It should be of great interest both to researchers of machine vision and to practitioners in various application areas.

[Computer Analysis of Visual Textures](#) Fumiaki Tomita, Saburo Tsuji, 2013-11-11
This book presents theories and techniques for perception of textures by computer. Texture is a homogeneous visual pattern that we perceive in surfaces of objects such as textiles, tree barks, or stones. Texture analysis is one of the first important steps in computer vision, since texture provides important cues to recognize real world objects. A major part of the book is devoted to two dimensional analysis of texture patterns by extracting statistical and structural features. It also deals with the shape from texture problem, which addresses recovery of the three dimensional surface shapes based on the geometry of projection of the surface texture to the image plane. Perception is still largely mysterious. Realizing a computer vision system that can work in the real world requires more research and experiment. Capability of textural perception is a key component. We hope this book will contribute to the advancement of computer vision toward robust, useful systems. We would like to express our appreciation to Professor Takeo Kanade at Carnegie Mellon University for his encouragement and help in writing this book, to the members of Computer Vision Section at Electro-Technical Laboratory for providing an excellent research environment, and to Carl W. Harris at Kluwer Academic Publishers for his help in preparing the manuscript.
