potentially offer many advantages over current clinical standards In addition to being objective and naturalistic they can also be collected remotely with minimal instruction and time requirements Furthermore Machine Learning algorithms developed to build automated diagnostic models using linguistic features extracted from speech could aid diagnosis of patients with probable diseases from a group of normal population To ensure that speech based biomarkers are providing accurate measurement and can serve as effective clinical tools for detecting and monitoring disease speech features extracted and analyzed must be systematically and rigorously evaluated Different machine learning architectures trained to classify different types of disordered speech must also be rigorously tested and systematically compared *Report* ,1954
