## **Tree Automata And Languages:**

Tree Automata and Languages M. Nivat, A. Podelski, 1992-11-08 The theory of tree languages founded in the late Sixties and still active in the Seventies was much less active during the Eighties Now there is a simultaneous revival in several countries with a number of significant results proved in the past five years A large proportion of them appear in the present volume The editors of this volume suggested that the authors should write comprehensive half survey papers This collection is therefore useful for everyone interested in the theory of tree languages as it covers most of the recent questions which are not treated in the very few rather old standard books on the subject Trees appear naturally in many chapters of computer science and each new property is likely to result in improvement of some computational solution of a real problem in handling logical formulae data structures programming languages on systems algorithms etc The point of view adopted here is to put emphasis on the properties themselves and their rigorous mathematical exposition rather than on the many possible applications This volume is a useful source of concepts and methods which may be applied successfully in many situations its philosophy is very close to the whole philosophy of the ESPRIT Basic Research Actions and to that of the European Association for Theoretical Computer Science

Kuich, A. Salomaa, 2012-12-06 Automata theory is the oldest among the disciplines constituting the subject matter of this Monograph Series theoretical computer science Indeed automata theory and the closely related theory of formal languages form nowadays such a highly developed and diversified body of knowledge that even an exposition of reasonably important results is not possible within one volume The purpose of this book is to develop the theory of automata and formal languages starting from ideas based on linear algebra By what was said above it should be obvious that we do not intend to be encyclopedic However this book contains the basics of regular and context free languages including some new results as well as a rather complete theory of pushdown automata and variations e g counter automata The wellknown AFL theory is extended to power series AFP theory Additional new results include for instance a grammatical characterization of the cones and the principal cones of context free languages as well as new decidability results ***Automata, Languages and Programming*** Michele Bugliesi, Bart Preneel, Vladimiro Sassone, Ingo Wegener, 2006-06-29 The two volume set LNCS 4051 and LNCS 4052 constitutes the refereed proceedings of the 33rd International Colloquium on Automata Languages and Programming ICALP 2006 held in Venice Italy July 2006 In all these volumes present more 100 papers and lectures Volume II 4052 presents 2 invited papers and 2 additional conference tracks with 24 papers each focusing on algorithms automata complexity and games as well as on security and cryptography foundation *Automata, Languages, and Programming*, 2005 ***State Complexity of Tree Automata*** Xiaoxue Piao, 2012 Modern applications of XML use automata operating on unranked trees A common definition of tree automata operating on

unranked trees uses a set of vertical states that define the bottom up computation and the transitions on vertical states are determined by so called horizontal languages recognized by finite automata on strings The bottom up computation of an unranked tree automaton may be either deterministic or nondeterministic and further variants arise depending on whether the horizontal string languages defining the transitions are represented by DFAs or NFAs There is also an alternative syntactic definition of determinism introduced by Cristau et al It is known that a deterministic tree automaton with the smallest total number of states does not need to be unique nor have the smallest possible number of vertical states We consider the question by how much we can reduce the total number of states by introducing additional vertical states We give an upper bound for the state trade off for deterministic tree automata where the horizontal languages are defined by DFAs and a lower bound construction that for variable sized alphabets is close to the upper bound We establish upper and lower bounds for the state complexity of conversions between different types of deterministic and nondeterministic unranked tree automata The bounds are usually tight for the numbers of vertical states Because a minimal deterministic unranked tree automaton need not be unique establishing lower bounds for the number of horizontal states that is the combined size of DFAs used to define the horizontal languages is challenging Based on existing lower bound results for unambiguous finite automata we develop a lower bound criterion for the number of horizontal states We consider the state complexity of operations on regular unranked tree languages The concatenation of trees can be defined either as a sequential or a parallel operation Furthermore there are two essentially different ways to iterate sequential concatenation We establish tight state complexity bounds for concatenation like operations In particular for sequential concatenation and bottom up iterated concatenation the bounds differ by an order of magnitude from the corresponding state complexity bounds for regular string languages
