**Working Models of Human Perception** Ben A. G. Elsendoorn, Herman Bouma, 1989 This book devotes attention to both theoretical and applied problems simultaneously Many applied problems turn out to be very difficult and they often need deep theoretical insight in order to get solved In fact applied problems often serve as a source of inspiration for theoretical work since they usually are beyond reach of present theories and may show us in what direction theories need to be developed The layout of the book is a reflection of the three main areas of research at the Institute for Perception Research Hearing and Speech Vision and Reading Cognition and Communication Following the set up of the workshop the organization of the papers is in pairs such that the odd numbered chapters are generally reactions to the even numbered chapters 12th Annual Conference. **Handbook of Applied Cognition** Raymond S. Nickerson, 1999-07-09 Cognitive psychology is the basis of many applications in almost every area of technology business industry and education This book provides workers in applied arenas with presentations of research aimed directly at the problems and issues that confront them It will cover key areas including business and industry computers and technology education and information and health and law **Instructable Autonomous Agents** Scott B. Huffman, 1994 Abstract In contrast to current intelligent systems which must be laboriously programmed for each task they are meant to perform instructable agents can be taught new tasks and associated knowledge This thesis presents a general theory of learning from tutorial instruction and its use to produce an instructable agent Tutorial instruction is a particularly powerful form of instruction because it allows the instructor to communicate whatever kind of knowledge a student needs at whatever point it is needed To exploit this broad flexibility however a tutorable agent must support a full range of interaction with its instructor to learn a full range of knowledge Thus unlike most machine learning tasks which target deep learning of a single kind of knowledge from a single kind of input tutorability requires a breadth of learning from a broad range of instructional interactions The theory of learning from tutorial instruction presented here has two parts First a computational model of an intelligent agent the problem space computational model indicates the types of knowledge that determine an agent s performance and thus that should be acquirable via instruction Second a learning technique called situated explanation specifies how the agent learns general knowledge from instruction The theory is embodied by an implemented agent Instructo Soar built within the Soar architecture Instructo Soar is able to learn hierarchies of completely new tasks to extend task knowledge to apply in new situations and in fact to acquire every type of knowledge it uses during task performance control knowledge knowledge of operator s effects state inferences etc

from interactive natural language instructions This variety of learning occurs by applying the situated explanation technique to a variety of instructional interactions involving a variety of types of instructions commands statements conditionals etc By taking seriously the requirements of flexible tutorial instruction Instructo Soar demonstrates a breadth of interaction and learning capabilities that goes beyond previous instructable systems such as learning apprentice systems Instructo Soar s techniques could form the basis for future instructable technologies that come equipped with basic capabilities and can be taught by novice users to perform any number of desired tasks **Multimedia Computing and Networking** ,2001
