Spectrum Estimation System Identificat:

Spectrum Estimation and System Identification S.Unnikrishna Pillai,Theodore I. Shim,2012-12-06 Spectrum estimation refers to analyzing the distribution of power or energy with frequency of the given signal and system identification refers to ways of characterizing the mechanism or system behind the observed signal data Such an identification allows one to predict the system outputs and as a result this has considerable impact in several areas such as speech processing pattern recognition target identification seismology and signal processing A new outlook to spectrum estimation and system identification is presented here by making use of the powerful concepts of positive functions and bounded functions An indispensable tool in classical network analysis and synthesis problems positive functions and bounded functions are well and their intimate one to one connection with power spectra understood makes it possible to study many of the signal processing problems from a new viewpoint Positive functions have been used to study interpolation problems in the past and although the spectrum extension problem falls within this scope surprisingly the system identification problem can also be analyzed in this context in an interesting manner One useful result in this connection is regarding rational and stable approximation of nonrational transfer functions both in the single channel case and the multichannel case Such an approximation has important applications in distributed system theory simulation of systems governed by partial differential equations and analysis of differential equations with delays This book is intended as an introductory graduate level textbook and as a reference book for engineers and researchers

Spectrum Estimation and System Identification Relying on a Fourier Transform David R. Brillinger,John Wilder Tukey,1982

System Identification 2003 Paul Van Den Hof,Bo Wahlberg,Siep Weiland,2004-06-29 The scope of the symposium covers all major aspects of system identification experimental modelling signal processing and adaptive control ranging from theoretical methodological and scientific developments to a large variety of engineering application areas It is the intention of the organizers to promote SYSID 2003 as a meeting place where scientists and engineers from several research communities can meet to discuss issues related to these areas Relevant topics for the symposium program include Identification of linear and multivariable systems identification of nonlinear systems including neural networks identification of hybrid and distributed systems Identification for control experimental modelling in process control vibration and modal analysis model validation monitoring and fault detection signal processing and communication parameter estimation and inverse modelling statistical analysis and uncertainty bounding adaptive control and data based controller tuning learning data mining and Bayesian approaches sequential Monte Carlo methods including particle filtering applications in process control systems motion control systems robotics aerospace systems bioengineering and medical systems physical measurement systems automotive systems econometrics transportation and communication systems Provides the latest research on System Identification Contains contributions written by experts in the field Part of the IFAC Proceedings Series which provides a comprehensive overview of the major topics in control engineering

Identification and System Parameter Estimation, 1985 H. A. Barker, Peter C. Young, 1985 Identification and System Parameter Estimation ,1989 *Signals and Systems in Biomedical Engineering: Physiological Systems Modeling and Signal Processing* Suresh R. Devasahayam, 2019-03-29 Physiology is a set of processes that maintain homeostasis and physiological measurement is a means of observing these processes Systems theory and signal processing offer formal tools for the study of processes and measured quantities This book shows that systems modeling can be used to develop simulations of physiological systems which use formal relations between the underlying processes and the observed measurements The inverse of such relations suggest signal processing tools that can be applied to interpret experimental data Both signal processing and systems modeling are invaluable in the study of human physiology Discussing signal processing techniques ranging from filtering and spectrum analysis to wavelet analysis the book uses graphs and analogies to supplement the mathematics and make the book more accessible to physiologists and more interesting to engineers Physiological systems modeling helps in both gaining insight and generating methods of analysis This book shows how numerical computation with graphical display haptics and multimedia can be used to simulate physiological systems In this third edition the simulations are more closely related to clinical examination and experimental physiology than in previous editions Detailed models of nerve and muscle at the cellular and systemic levels and simplified models of cardiovascular blood flow provide examples for the mathematical methods and computer simulations Several of the models are sufficiently sophisticated to be of value in understanding real world issues like neuromuscular disease The book features expanded problem sets and a link to extra downloadable material containing simulation programs that are solutions to the theory developed in the text
