Microstructure and Properties of Materials James Chen-Min Li,1996 This is the second volume of an advanced textbook on microstructure and properties of materials The first volume is on aluminum alloys nickel based superalloys metal matrix composites polymer matrix composites ceramics matrix composites inorganic glasses superconducting materials and magnetic materials It covers titanium alloys titanium aluminides iron aluminides iron and

steels iron based bulk amorphous alloys and nanocrystalline materials There are many elementary materials science textbooks but one can find very few advanced texts suitable for graduate school courses The contributors to this volume are experts in the subject and hence together with the first volume it is a good text for graduate microstructure courses It is a rich source of design ideas and applications and will provide a good understanding of how microstructure affects the properties of materials Chapter 1 on titanium alloys covers production thermomechanical processing microstructure mechanical properties and applications Chapter 2 on titanium aluminides discusses phase stability bulk and defect properties deformation mechanisms of single phase materials and polysynthetically twinned crystals and interfacial structures and energies between phases of different compositions Chapter 3 on iron aluminides reviews the physical and mechanical metallurgy of Fe₃Al and FeAl the two important structural intermetallics Chapter 4 on iron and steels presents methodology microstructure at various levels strength ductility and strengthening toughness and toughening environmental cracking and design against fracture for many different kinds of steels Chapter 5 on bulk amorphous alloys covers the critical cooling rate and the effect of composition on glass formation and the accompanying mechanical and magnetic properties of the glasses Chapter 6 on nanocrystalline materials describes the preparation from vapor liquid and solid states microstructure including grain boundaries and their junctions stability with respect to grain growth particulate consolidation while maintaining the nanoscale microstructure physical chemical mechanical electric magnetic and optical properties and applications in cutting tools superplasticity coatings transformers magnetic recordings catalysis and hydrogen storage

Austenitic Stainless Steels P. Marshall,1984-07-31 ***New Advanced High Strength Steels*** Mohamed Goune,Thierry Jung,Jean-Hubert Schmitt,2024-01-04 In recent years significant developments have been made to increase the mechanical strength of steels in order to reduce the overall weight of structures particularly in motor vehicles Depending on the application the increase in strength should not be at the expense of forming and in use properties The development of ultra high strength steels requires a search for new trade offs between these properties in order to optimize the final microstructure *New Advanced High Strength Steels* analyzes the interactions between tensile mechanical properties and properties such as work hardening anisotropy resistance to rupture fatigue life corrosion resistance crashworthiness edge retention hydrogen resistance and weldability It also examines the links between the microstructural parameters of high

strength steels and the properties mentioned above It highlights the metallurgical developments that have been necessary for the emergence of these new generations of steels The book concludes with a look ahead to future developments in ultra high strength steels Processing, Microstructure and Properties of HSLA Steels Anthony J.
