Still Image Compression On Parallel Computer Architectures:

Still Image Compression on Parallel Computer Architectures Savitri Bevinakoppa, 1998-11-30 Still Image Compression on Parallel Computer Architectures investigates the application of parallel processing techniques to digital image compression. Digital image compression is used to reduce the number of bits required to store an image in computer memory and or transmit it over a communication link. Over the past decade advancements in technology have spawned many applications of digital imaging such as photo videotex desktop publishing graphics arts color facsimile newspaper wire phototransmission and medical imaging. For many other contemporary applications such as distributed multimedia systems rapid transmission of images is necessary. Dollar cost as well as time cost of transmission and storage tend to be directly proportional to the volume of data. Therefore application of digital image compression techniques becomes necessary to minimize costs. A number of digital image compression algorithms have been developed and standardized. With the success of these algorithms research effort is now directed towards improving implementation techniques. The Joint Photographic Experts Group JPEG and Motion Photographic Experts Group MPEG are international organizations which have developed digital image compression standards. Hardware VLSI chips which implement the JPEG image compression algorithm are available. Such hardware is specific to image compression only and cannot be used for other image processing applications. A flexible means of implementing digital image compression algorithms is still required. An obvious method of processing different imaging applications on general purpose hardware platforms is to develop software implementations. JPEG uses an 8 x 8 block of image samples as the basic element for compression. These blocks are processed sequentially. There is always the possibility of having similar blocks in a given image. If similar blocks in an image are located then repeated compression of these blocks is not necessary. By locating similar blocks in the image the speed of compression can be increased and the size of the compressed image can be reduced. Based on this concept an enhancement to the JPEG algorithm is proposed called Block Comparator Technique (BCT). Still Image Compression on Parallel Computer Architectures is designed for advanced students and practitioners of computer science. This comprehensive reference provides a foundation for understanding digital image compression techniques and parallel computer architectures.

Signal Processing for Image Enhancement and Multimedia Processing Ernesto Damiani, Albert Dipanda, Kokou Yetongnon, Louis Legrand, Peter Schelkens, Richard Chbeir, 2007-12-03 Traditionally signal processing techniques lay at the foundation of multimedia data processing and analysis. In the past few years a new wave of advanced signal processing techniques has delivered exciting results increasing systems capabilities of efficiently exchanging image data and extracting useful knowledge from them. Signal Processing for Image Enhancement and Multimedia Processing is an edited volume written by well recognized international researchers with extended chapter style versions of the best papers presented at the SITIS 2006 International Conference. This book presents the state of the art and recent research

results on the application of advanced signal processing techniques for improving the value of image and video data It also discusses feature based techniques for deep feature oriented analysis of images and new results on video coding on the honored topic of securing image information Signal Processing for Image Enhancement and Multimedia Processing is designed for a professional audience composed of practitioners and researchers in industry This volume is also suitable as a reference or secondary text for advanced level students in computer science and engineering The chapters included in this book are a selection of papers presented at the Signal and Image Technologies track of the international SITIS 2006 conference The authors were asked to revise and extend their contributions to take into account the many challenges and remarks discussed at the conference A large number of high quality papers were submitted to SITIS 2006 demonstrating the growing interest of the research community for image and multimedia processing

Computed Synchronization for Multimedia

Applications Charles B. Owen, Fillia Makedon, 2013-04-17 Multimedia is changing the design of database and information retrieval systems The accumulation of audio image and video content is of little use in these systems if the content cannot be retrieved on demand a critical requirement that has led to the development of new technologies for the analysis and indexing of media data In turn these technologies seek to derive information or features from a data type that can facilitate rapid retrieval efficient compression and logical presentation of the data Significant work that has not been addressed however is the benefits of analyzing more than one data type simultaneously Computed Synchronization for Multimedia Applications presents a new framework for the simultaneous analysis of multiple media data objects The primary benefit of this analysis is computed synchronization a temporal and spatial alignment of multiple media objects Computed Synchronization for Multimedia Applications also presents several specific applications and a general structure for the solution of computed synchronization problems The applications demonstrate the use of this structure Two applications in particular are described in detail the alignment of text to speech audio and the alignment of simultaneous English language translations of ancient texts Many additional applications are discussed as future uses of the technology Computed Synchronization for Multimedia Applications is useful to researchers students and developers seeking to apply computed synchronization in many fields It is also suitable as a reference for a graduate level course in multimedia data retrieval

on the Internet Veljko Milutinovic, 2012-12-06 Design is an art form in which the designer selects from a myriad of alternatives to bring an optimum choice to a user In many complex of optimum is difficult to define Indeed the users systems the notion themselves will not agree so the best system is simply the one in which the designer and the user have a congruent viewpoint Compounding the design problem are tradeoffs that span a variety of technologies and user requirements The electronic business system is a classically complex system whose tradeoff criteria and user views are constantly changing with rapidly developing underlying technology Professor Milutinovic has chosen this area for his capstone contribution to the computer systems design This book completes his trilogy on design issues in computer systems

His first work *Surviving the Design of a 200 MHz RISC Microprocessor* 1997 focused on the tradeoffs and design issues within a processor His second work *Surviving the Design of Microprocessor and Multiprocessor Systems* 2000 considers the design issues involved with assembling a number of processors into a coherent system Finally this book generalizes the system design problem to electronic commerce on the Internet a global system of immense consequence
