**Vector Optimization** Guang-ya Chen, Xuexiang Huang, Xiaogi Yang, 2005-11-20 Vector optimization model has found many important applications in decision making problems such as those in economics theory management science and engineering design since the introduction of the Pareto optimal solution in 1896 Typical examples of vector optimization model include maximization minimization of the objective pairs time cost benefit cost and mean variance etc Many practical equilibrium problems can be formulated as variational inequality problems rather than optimization problems unless further assumptions are imposed The vector variational inequality was introduced by Giannessi 1980 Extensive research on its relations with vector optimization the existence of a solution and duality theory has been pursued The fundamental idea of the Ekeland's variational principle is to assign an optimization problem a slightly perturbed one having a unique solution which is at the same time an approximate solution of the original problem This principle has been an important tool for nonlinear analysis and optimization theory Along with the development of vector optimization and set valued optimization the vector variational principle introduced by Nemeth 1980 has been an interesting topic in the last decade Fan Ky's minimax theorems and minimax inequalities for real valued functions have played a key role in optimization theory game theory and mathematical economics An extension to vector payoffs was introduced by Blackwell 1955 Variational

Including variable ordering cones is especially important in applications such as medical image registration with uncertainties. This book covers a wide range of applications of set optimization. These range from finance investment insurance control theory economics to risk theory. As uncertain multi objective optimization especially robust approaches lead to set optimization one main focus of this book is uncertain optimization. Important recent developments concerning numerical methods for solving set optimization problems sufficiently fast are main features of this book. These are illustrated by various examples as well as easy to follow steps in order to facilitate the decision process for users. Simple techniques aimed at practitioners working in the fields of mathematical programming finance and portfolio selection are presented. These will help in the decision making process as well as give an overview of nondominated solutions to choose from.
