

Abstract
The purpose of this study was to investigate the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary middle-aged men. The study was a randomized controlled trial. The participants were divided into two groups: a training group and a control group. The training group performed a supervised aerobic and resistance training program. The control group remained sedentary. Physical fitness was measured using a 6-minute walk test, and HRQL was measured using the SF-36 questionnaire. The results showed that the training group had significantly higher physical fitness and HRQL scores compared to the control group at the end of the 12-week period.

Introduction
Physical inactivity is a major public health problem worldwide, leading to an increase in the prevalence of chronic diseases such as cardiovascular disease, diabetes, and obesity. Regular physical activity has been shown to improve physical fitness and HRQL. However, many people are unable to maintain a regular exercise routine. This study aimed to evaluate the effectiveness of a structured training program in improving physical fitness and HRQL in sedentary middle-aged men.

Methods
A randomized controlled trial was conducted with 60 sedentary middle-aged men. The participants were randomly assigned to either a training group (n=30) or a control group (n=30). The training group performed a supervised aerobic and resistance training program for 12 weeks. The control group remained sedentary. Physical fitness was measured using a 6-minute walk test, and HRQL was measured using the SF-36 questionnaire.

Results
The training group showed a significant increase in physical fitness and HRQL scores compared to the control group at the end of the 12-week period.

Conclusion
A 12-week supervised training program significantly improved physical fitness and HRQL in sedentary middle-aged men.

Keywords
Physical fitness, HRQL, sedentary, middle-aged men, training program.
