Virtual Reality Conference 2003 (VR 2003). Jim Chen, 2003 *Driving in Virtual Reality* Björn Blissling, 2020-09-02

In the last decades there has been a substantial increase in the development of complex active safety systems for automotive vehicles. These systems need to be tested for verification and validation to ensure that the system intervenes in the correct situations using the correct measures. There are multiple methods available to perform such testing. Software in the loop and hardware in the loop testing offer effective driverless testing. Other methods increase the fidelity by including human drivers such as driving simulators and experiments performed at test tracks. This thesis examines vehicle in the loop testing an innovative method where the driver of a real vehicle wears a head mounted display that displays virtual targets. This method combines the benefits of driving simulators with the benefits of using a real vehicle on a test track. Driving simulators offer repeatability, safety and the possibility of complex interactions between actors. In contrast the real vehicle provides the correct vehicle dynamics and motion feedback. There is a need to know how the technology behind the method might influence the results from vehicle in the loop testing. Two techniques for vehicle in the loop systems are studied. The first involves video see through head mounted displays where the focus of the research is on the effects of visual latency on driving behavior. The results show that lateral driving behavior changes with added latency but longitudinal behavior appears unaffected. The second system uses an opaque head mounted display in an entirely virtual world. The research shows that this solution changes speed perception and results in a significant degradation in performance of tasks dependent on visual acuity. This research presents results that are relevant to consider when developing vehicle in the loop platforms. The results are also applicable when choosing scenarios for this test method.

Dagens fordon innehåller fler och fler säkerhetssystem. Vissa av dessa system ger varningar i potentiellt kritiska trafiksituationer. Det finns också mer komplexa system som till exempel kan ta kontroll över fordonet för att förhindra en olycka eller åtminstone mildra effekterna. Komplexiteten hos dessa system innebär att man måste genomföra omfattande tester. Både för att se att systemen reagerar vid rätt tidpunkt men också för att se att valet av tgrd är korrekt. Det finns många olika sätt att testa dessa system. Man börjar vanligtvis med simuleringar av programvara och hårdvara. Därefter kan systemet introduceras i ett fordon för att se vilka effekter systemet har när det interagerar med en riktig förare. Att utföra tester med förare ställer dock höga säkerhetskrav och det är ofta svårt att samordna komplexa trafiksituationer på en testbana. Traditionellt har simulatorer varit ett naturligt alternativ eftersom de kan utföra komplexa scenarier i en säker miljö. Denna avhandling undersöker en testmetod där man utrustar föraren med en virtual reality display. Genom att presentera omvärlden med hjälp av virtual reality så kan man genomföra scenarier som tidigare varit omöjliga på en testbana. Det kan dock finnas inbyggda begränsningar i virtual reality tekniken som kan påverka utförandet. Det är därför viktigt att hitta och kvantifiera dessa effekter för att kunna lita på resultaten från testmetoden. Att känna till dessa effekter på utförandet dessutom kan hjälpa till att avgöra vilka typer av scenarier som är lämpliga för denna testmetod. Det är också viktig information för att avgöra
