The Art of Differentiating Computer Programs Uwe Naumann,2012-01-01 This is the first entry level book on algorithmic also known as automatic differentiation AD providing fundamental rules for the generation of first and higher order tangent linear and adjoint code The author covers the mathematical underpinnings as well as how to apply these observations to real world numerical simulation programs Readers will find examples and exercises including hints to solutions the prototype AD tools dco and dcc for use with the examples and exercises first and higher order tangent linear and adjoint modes for a limited subset of C C provided by the derivative code compiler dcc a supplementary website containing sources of all software discussed in the book additional exercises and comments on their solutions growing over the coming years links to other sites on AD and errata

Automatic Differentiation in MATLAB Using ADMAT with Applications Thomas F. Coleman,Wei Xu,2016-06-20 The calculation of partial derivatives is a fundamental need in scientific computing Automatic differentiation AD can be applied straightforwardly to obtain all necessary partial derivatives usually first and possibly second derivatives regardless of a code s complexity However the space and time efficiency of AD can be dramatically improved sometimes transforming a problem from intractable to highly feasible if inherent problem structure is used to apply AD in a judicious manner Automatic Differentiation in MATLAB using ADMAT with Applications discusses the efficient use of AD to solve real problems especially multidimensional zero finding and optimization in the MATLAB environment This book is concerned with the determination of the first and second derivatives in the context of solving scientific computing problems with an emphasis on optimization and solutions to nonlinear systems The authors focus on the application rather than the implementation of AD solve real nonlinear problems with high performance by exploiting the problem structure in the application of AD and provide many easy to understand applications examples and MATLAB templates

Time-dependent Methods for Quantum Dynamics Kenneth C. Kulander, 1991 This collection of articles clearly demonstrates that recent developments in time dependent computational methods for quantum processes have resulted in significant contributions to the understanding of a remarkable broad spectrum of physical and chemical processes These advances happened for two reasons First substantial improvements in the tools we use have occurred over the past decade and second there is a remarkable decrease in timescale over which observations of dynamical processes can be carried out The papers presented here treat a wide variety of topics including laser induced dynamics by intense fields and short pulses spectroscopy tunneling resonances photodissociation atomic collisions and gas surface collisions chemical reactions molecular energy transfer intramolecular relaxation the influence of phase space structure on quantum dynamics nonadiabatic processes in condensed phases systems in baths nuclear collisions fission and fusion The methods used in this issue include wave packet propagation Fourier transforms time dependent mean field SCF methods time dependent correlation functions path integrals combined quantum classical methods hydrodynamic and fluid dynamical analogs quantum statistical mechanics perturbation theory optical potentials and optimal control theory This collection of time

dependent techniques is supplemented by a collection of 22 programs Two of these are described in detail in the text The programs are available in any desirable format and can be ordered by completing the coupon enclosed with the book
