

Remove X Windows

A server will not typically need X Windows to provide its services, so remove it if possible:

```
yum groupremove "X Window System"
```

Installation of X Windows can also be completely prevented during initial system installation.

Configure and Use Iptables and TCP Wrapper

The Iptables firewall should be configured to allow only necessary network communications. For workstations, this may entail blocking all incoming communications, except for those related to connections the system initiated. If Iptables is currently running, view the current firewall policy with the following command:

```
iptables-save -c
```

By default, the output should correspond to rules stored in the file `/etc/sysconfig/iptables`. Understand and edit these rules, removing any lines that allow unnecessary communications. To activate the updated rules, restart the service:

Also configure the TCP Wrapper library to protect network daemons that support its use by adding appropriate rules to `/etc/hosts.allow` and `/etc/hosts.deny`.

Configure and Use SELinux

The default SELinux policy, called `targeted`, provides protection against compromised or misconfigured system services. This policy should not interfere with normal system operation. Ensure that `/etc/selinux/config` includes the following lines:

```
SELINUX=enforcing  
SELINUXTYPE=targeted
```

Stronger policies such as `strict` and `mls` can be used if appropriate. However, these require customization to operate successfully for many general-purpose usage scenarios.

Set Kernel Parameters

At boot, the system reads and applies a set of kernel parameters from `/etc/sysctl.conf`. Add the following lines to that file to prevent certain kinds of attacks:

```
net.ipv4.conf.all.rp_filter=1  
net.ipv4.conf.all.arp_ignore=2  
net.ipv4.conf.all.arp_announce=2
```

```
net.ipv4.conf.default.rp_filter=1  
net.ipv4.conf.default.arp_ignore=2  
net.ipv4.conf.default.arp_announce=2
```

For more possible parameters, including settings for IPv6, please see our complete guide.

NTP

For most systems, the `ntp` service introduces unnecessary overhead. Instead, call its update utility, `ntpdate`, directly through a cron job. Create the file `/etc/cron.daily/ntpdate` with the following line:

```
*/5 * * * * root /usr/sbin/ntpdate server
```

Substitute an appropriate NTP server for `server`. Hosts on a network should synchronize their time from a local NTP server, and then only this local NTP server should acquire the time from an external, trusted source.

Configure or Disable SSH

SSH is often required, but if it is not, disable it:

```
sshd -e --rootdir /dev/null
```

If SSH is required, ensure the SSH configuration file `/etc/ssh/sshd_config` includes the following lines:

```
PermitRootLogin no  
Protocol 2
```

If possible, limit SSH access to a subset of users. Create a group called `sshusers` and only add the users that need remote access. Then, add the following line to `/etc/ssh/sshd_config`:

```
AllowTcpForwarding no
```

Restart the service so that these changes take effect.

Disable IPv6

Unless your policy or network configuration requires it, disable IPv6. To do so, prevent the kernel module from loading by adding the following line to

```
/etc/modprobe.conf:
```

```
install ipv6 /bin/false
```

Next, add or change the following lines in

```
/etc/sysconfig/iptables to
```

```
blockstate ipv6 1  
blockstate ip6 1
```
