Abstract

We formalize the general principle of significance with respect to binary relations which is a universal tool for description and analysis of various situations in and apart from mathematics. We derive the basic properties and focus on a special family of relations induced by linear orders. We show several ways of mathematical applications, propose methods for calculating the required set and sketch possible use in other sciences.

Keywords: significance, choice, dominated alternative

0.1 Motivation

Consider a set A and two mappings $f, g : A \rightarrow \mathbb{R}$. Suppose these functions describe two quantities which tend to induce the same orders, e.g., the circumference and the area of a triangle. Then one may ask for a set of those elements of A which have large value of f considering the smallness of g . In other words, we look for the elements which are big w.r.t. f and small w.r.t. g simultaneously. It means that we want to pick those triangles which have the smallest circumference for a given area or the largest area for a given circumference. This will be expressed exactly by the property $\phi(a)$ of an element $a \in A$ by: for every $b \in A$,

- $f(a) < f(b) \Rightarrow g(a) < g(b)$,
- $g(a) > g(b) \Rightarrow f(a) > f(b)$.

The resulting set of all elements a satisfying $\phi(a)$ will be denoted by \mathcal{V} . It will now satisfy the property of the same function-induced orders exactly. In case of triangles, \mathcal{V} is the set of equilateral triangles since, for a given area, it has the smallest circumference.

One may add another quantity $h : A \rightarrow \mathbb{R}$ and compare f, g, h by enlarging, diminishing and diminishing, respectively. I.e., we search for elements a satisfying the property $\psi(a)$: for every $b \in A$
