Stars: Birth, life and death

What are stars?

Stars are huge, glowing balls of hot gas consisting mostly of hydrogen and helium. They generate energy through nuclear fusion, which they radiate as light and heat.

Each star has a different size, color and temperature. The color of a star indicates its temperature. Blue stars are hottest, and stars are cooler.

Stars play a central role in the universe as they provide light and energy and produce heavier elements.

Small vs. large stars

Small stars, such as red dwarfs, live for a very long time as they consume their fuel slowly. They often appear as white dwarfs.

Big stars, such as blue giants, are much hotter and brighter, but consume their fuel more quickly. They end as supernovae and leave behind neutron stars.

Supernovae

A supernova is a huge explosion that marks the end of a massive star. An enormous amount of energy is released, making the star appear brighter than an entire galaxy for a short time.

The explosion hurls heavy elements such as iron and gold into space, which can later become part of new stars and planets.

Supernovae are important processes in the universe, as they spread matter and create new stars.

Formation in nebulae

Nebulae are huge clouds of gas and dust in space. They are the birthplaces of stars. Within these clouds, such as the Orion Nebula, matter slowly gathers.

Gravity compresses parts of the cloud until a dense core forms. This core grows and becomes hotter and brighter as it pulls matter further together.

As the core gets denser, it pulls in more gas and dust from the surrounding gas and creates the protostar.

Black holes

A black hole is formed when a very massive star collapses. The gravitational force is so strong that even light cannot escape.

Black holes affect matter and time in strong ways in their surroundings. They can grow as they absorb more matter.

Life cycle

Stars follow different life cycles depending on their mass. They begin as a protostar, develop into a main sequence star and end as a white dwarf, neutron star or black hole, depending on their mass.

Low-mass stars live for billions of years while it changes into helium. When the fuel runs out, it becomes a white dwarf.

High-mass stars live for millions of years and end as a supernova, leaving behind a neutron star or black hole.
