Faster, Better, Cheaper Howard E. McCurdy, 2003-04-01 This excellent summary of an important part of NASA's history is recommended for all readers Choice In Faster Better Cheaper Low Cost Innovation in the U S Space Program Howard E McCurdy examines NASA's recent efforts to save money while improving mission frequency and performance McCurdy details sixteen missions undertaken as the twentieth century drew to a close including an orbit of the moon deployment of three space telescopes four Earth orbiting satellites two rendezvous with comets and asteroids and a test of an ion propulsion engine which cost less than the sum traditionally spent on a single conventionally planned planetary mission He shows how these missions employed smaller spacecraft and cheaper technology to undertake less complex and more specific tasks in outer space While the technological innovation and space exploration approach that McCurdy describes is still controversial the historical perspective on its disappointments and triumphs points to ways of developing faster better and cheaper as a management manifesto Readers interested in either the management or economics of complex organizations will find a wealth of material in this well written exposition Fans of space travel like the author himself will also enjoy the behind the scenes look at NASA's operation Enterprise and Society [Space Invaders](#) Michel van Pelt, 2010-05-05

The Complete Book of Spacecraft Michael H. Gorn, Davide Sivolella, 2025-08-26 Marvel at the history of space exploration through its daring vehicles exhaustively chronicled in this authoritative volume featuring more than 250 artworks In 1957 the world looked on with both uncertainty and amazement as the Soviet Union launched Sputnik 1 the first man made orbiter Sputnik 1 would spend three months circling Earth every 98 minutes and cover 71 million miles in the process The world's space programs have traveled far literally and figuratively

since then and the spacecraft they have developed and deployed represent almost unthinkable advances for such a relatively short period In *Spacecraft* illustrator and aerospace professional Giuseppe De Chiara teams up with aerospace historian Michael Gorn to present a huge profusely illustrated aerospace history profiling and depicting spacecraft from Sputnik 1 through the International Space Station and everything in between including concepts that have yet to actually venture outside the Earth's atmosphere This updated and revised edition includes Expertly written profiles depicting and describing the design development and deployment of manned and unmanned spacecraft from around the world including satellites capsules spaceplanes rockets and space stations now updated with the latest models Vivid scale illustrations of the many international spacecraft in multiple view sometimes cross section and in many cases shown in archival period photography to provide further historical context Earthbound and spaceborne data and intel chronicling every technological leap engineering challenge and monumental achievement from troubleshooting the lunar landers of the 60s to engineering solar driven sails to propel futuristic craft to Mars and beyond A look ahead to an era of privatized space travel and even plans for lunar and Martian space stations and settlement Dividing the book by era De Chiara and Gorn feature spacecraft not only from the United States and Soviet Union Russia but also from the European Space Agency and China The mind blowing machines examined in this volume include the rockets Energia Falcon 9 and VEGA the Hubble Space Telescope the Cassini space probe and the Mars rovers Opportunity and Curiosity For anyone who has marveled at humankind's attempts and advances in leaving Earth *Spacecraft The Complete Guide to the Rockets Satellites Capsules Shuttles and Stations That Put Us in Space* is the definitive reference **To Orbit and Back Again** Davide Sivolella, 2013-08-27

The Space Shuttle has been the dominant machine in the U S space program for thirty years and has generated a great deal of interest among space enthusiasts and engineers This book enables readers to understand its technical systems in greater depth than they have been able to do so before The author describes the structures and systems of the Space Shuttle and then follows a typical mission explaining how the structures and systems were used in the launch orbital operations and the return to Earth Details of how anomalous events were dealt with on individual missions are also provided as are the recollections of those who built and flew the Shuttle Many photographs and technical drawings illustrate how the Space Shuttle functions avoiding the use of complicated technical jargon The book is divided into two sections Part 1 describes each subsystem in a technical style supported by diagrams technical drawings and photographs to enable a better understanding of the concepts Part 2 examines different flight phases from liftoff to landing Technical material has been obtained from NASA as well as from other forums and specialists Author Davide Sivolella is an aerospace engineer with a life long interest in space and is ideally qualified to interpret technical manuals for a wider audience This book provides comprehensive coverage of the topic including the evolution of given subsystems reviewing the different configurations and focusing on the solutions implemented

Tribble,2020-05-05 The breakup of the Space Shuttle Columbia as it reentered Earth s atmosphere on February 1 2003 reminded the public and NASA of the grave risks posed to spacecraft by everything from insulating foam to space debris Here Alan Tribble presents a singular up to date account of a wide range of less conspicuous but no less consequential environmental effects that can damage or cause poor performance of orbiting spacecraft Conveying a wealth of insight into the nature of the space environment and how spacecraft interact with it he covers design modifications aimed at eliminating or reducing such environmental effects as solar absorptance increases caused by self contamination materials erosion by atomic oxygen electrical discharges due to spacecraft charging degradation of electrical circuits by radiation and bombardment by micrometeorites This book is unique in that it bridges the gap between studies of the space environment as performed by space physicists and spacecraft design engineering as practiced by aerospace engineers [Future of NASA](#) Daniel Morgan,2011 This is a print on demand edition of a hard to find publication Contents 1 Intro and Legislative Context 2 What is NASA for 3 What Should NASA Do Human Spaceflight The Vision for Space Exploration Current Program to Implement the Vision Cost and Schedule Why the Moon The Gap and Utilization of the Space Station Human Spaceflight The Augustine Comm Balancing Competing Priorities 4 Space Shuttle Program Why the Shuttle Program is Ending Possible Extension of the Shuttle Program 5 Internat Space Station 6 Future Access to Space Orion and Ares 7 Destinations for Human Exploration 8 Alternatives to Human Exploration Robotic Exploration 9 Other Space Policy Issues The U S Commercial Space Industry 10 Legislation in the 111th Congress Charts and tables [Mars Or Bust!](#) Ailynn Collins,2019-08 Discusses the challenges that scientists engineers and astronauts must overcome to make their dream of traveling to Mars a reality **Technology for Large Space Systems** ,1987 *Deep Space Propulsion* K. F. Long,2011-11-25 The technology of the next few decades could possibly allow us to explore with robotic probes the closest stars outside our Solar System and

maybe even observe some of the recently discovered planets circling these stars This book looks at the reasons for exploring our stellar neighbors and at the technologies we are developing to build space probes that can traverse the enormous distances between the stars In order to reach the nearest stars we must first develop a propulsion technology that would take our robotic probes there in a reasonable time Such propulsion technology has radically different requirements from conventional chemical rockets because of the enormous distances that must be crossed Surprisingly many propulsion schemes for interstellar travel have been suggested and await only practical engineering solutions and the political will to make them a reality This is a result of the tremendous advances in astrophysics that have been made in recent decades and the perseverance and imagination of tenacious theoretical physicists This book explores these different propulsion schemes all based on current physics and the challenges they present to physicists engineers and space exploration entrepreneurs This book will be helpful to anyone who really wants to understand the principles behind and likely future course of interstellar travel and who wants to recognize the distinctions between pure fantasy such as Star Trek s warp drive and methods that are grounded in real physics and offer practical technological solutions for exploring the stars in the decades to come
