Spacetime And Electromagnetism:

Spacetime and Electromagnetism John Randolph Lucas, Peter Edward Hodgson, 1990 Certain fundamental concepts are vital to understanding the world around us such as spacetime covered by the special theory of relativity and causality the effect of random events promoted by electromagnetism Discussing these the authors support a rationalist view of physics

Unified Field Mechanics: Natural Science Beyond The Veil Of Spacetime - Proceedings Of The IX Symposium Honoring Noted French Mathematical Physicist Jean-pierre Vigier Richard L Amoroso, Louis H Kauffman, Peter Rowlands, 2015-09-08 Unified Field Mechanics the topic of the 9th international symposium honoring noted French mathematical physicist Jean Pierre Vigier cannot be considered highly speculative as a myopic critic might surmise The 8th Vigier Symposium proceedings The Physics of Reality should in fact be touted as a companion volume because of its dramatic theoretical Field Mechanics in additional dimensionality Many still consider the Planck scale zero point field stochastic quantum foam as the basement of reality This could only be considered true under the limitations of the Copenhagen interpretation of quantum theory As we enter the next regime of Unified Field Mechanics we now know that the energy dependent Einstein Minkowski manifold called spacetime has a finite radius beyond which a large scale multiverse beckons So far a battery of 14 experiments has been designed to falsify the model When the 1st is successfully performed a revolution in Natural Science will occur This volume strengthens and expands the theoretical and experimental basis for that immanent new age

realm Gribbin remains the premier expositor of the latest developments Booklist on Schrödinger's Kittens and the Search for Reality *Electromagnetic Processes* Robert J. Gould, 2020-07-21 This book provides an understanding of the theoretical foundations for the calculation of electromagnetic processes Photon production processes are particularly important in astrophysics since almost all of our knowledge of distant astronomical objects comes from the detection of radiation from these sources Further the conditions therein are extremely varied and a wide variety of naturally occurring electromagnetic phenomena can be described by limiting forms of the basic theory The first chapter reviews some basic principles that are the underpinnings for a general description of electromagnetic phenomena such as special relativity and especially relativistic covariance Classical and quantum electrodynamics QED are then formulated in the next two chapters followed by applications to three basic processes Coulomb scattering Compton scattering and bremsstrahlung These processes are related to other phenomena such as pair production and the comparisons are discussed A unique feature of the book is its thorough discussion of the nonrelativistic limit of QED which is simpler than the relativistic theory in its formulation and applications The methods of the relativistic theory are introduced and applied through the use of notions of covariance to provide a shorter path to the more general theory The book will be useful for graduate students working in astrophysics and in certain areas of particle physics

Special Relativity in General Frames Éric Gourgoulhon, 2013-08-20 Special relativity is the basis of many fields in modern physics particle physics quantum field theory high energy astrophysics etc This theory is presented here by adopting a four dimensional point of view from the start An outstanding feature of the book is that it doesn't restrict itself to inertial frames but considers accelerated and rotating observers It is thus possible to treat physical effects such as the Thomas precession or the Sagnac effect in a simple yet precise manner In the final chapters more advanced topics like tensorial fields in spacetime exterior calculus and relativistic hydrodynamics are addressed In the last brief chapter the author gives a preview of gravity and shows where it becomes incompatible with Minkowsky spacetime Well illustrated and enriched by many historical notes this book also presents many applications of special relativity ranging from particle physics accelerators particle collisions quark gluon plasma to astrophysics relativistic jets active galactic nuclei and including practical applications Sagnac gyrometers synchrotron radiation GPS In addition the book provides some mathematical developments such as the detailed analysis of the Lorentz group and its Lie algebra The book is suitable for students in the third year of a physics degree or on a masters course as well as researchers and any reader interested in relativity Thanks to the geometric approach adopted this book should also be beneficial for the study of general relativity A modern presentation of special relativity must put forward its essential structures before illustrating them using concrete applications to specific dynamical problems Such is the challenge so successfully met of the beautiful book by Eric Gourgoulhon excerpt from the Foreword by Thibault Damour

Generally Covariant Unified Field Theory Myron Wyn Evans, 2006-06 This book is the first to describe a very successful objective unified field theory which emerged in 2003 and which is already mainstream physics Einstein Cartan Evans ECE field theory The latter completes the well known work of Einstein and Cartan who from 1925 to 1955 sought to unify field theory in physics with the principles of general relativity These principles are based on the need for objectivity in natural philosophy were first suggested by Francis Bacon in the sixteenth century and developed into general relativity in about 1915 In this year using Riemann geometry Einstein and Hilbert independently arrived at an objective field equation for gravitation Since then there have been many attempts to unify the 1915 gravitational theory with the other three fundamental fields electromagnetism the weak and strong fields As described for the first time in this book unification is achieved straightforwardly with the principles of standard Cartan geometry and the Evans Ansatz The latter shows that electromagnetism is spinning spacetime gravitation is curving spacetime and that they are unified with the structure or master equations of Cartan Quantum mechanics is unified with general relativity using the Evans Lemma and wave equation Technical appendices and charts are provided which show how all the major equations of physics are obtained from the ECE field theory and two introductory chapters describe the background mathematics from an elementary level The mathematical structure of ECE field theory is standard Cartan geometry also known as differential geometry The main topics of contemporary physics are covered in individual chapters which also describe the conditions under which ECE theory reduces to Einstein Hilbert EH theory and to Maxwell Heaviside field theory in classical electrodynamics The Dirac equation is derived as a limit of the wave equation of ECE theory The Schrodinger and Newton equations then follow as limits of the Dirac equation It is therefore shown that ECE field theory provides for the first time a structure for the objective unification of field theory in natural philosophy

A Spacetime Theory of Matter, Electromagnetism, and Gravitation Celestino John Gaeta, Ph.d., 2017-02-12 A six dimensional spacetime with three temporal and three spatial dimensions that is naturally perceived as a spacetime with one temporal and three spatial dimensions allows both quantized spacetime and free spacetime environments that do not exhibit singularities Physical constraints imposed by the solutions avoid closed time loops for matter Maxwell's equations with the correct signs are simply a subset of the equations resulting from setting the Ricci tensor elements equal to zero and account for the presence of electric charge The absence of observed magnetic charge is also explained The equations that result from setting the diagonal Ricci tensor elements equal to zero along with the equations of motion yield solutions that describe the nucleus and the electronic structure of atoms including

spin and intrinsic magnetic moments The solution for the nucleus explains the nature of mass and allows for calculation of nuclear size and mass consistent with experimental observations Anti matter quarks neutrinos neutron mass being slightly larger than proton mass beta inverse beta decay and instability of the neutron outside the nucleus all naturally follow from the solution to the differential equations describing the spacetime In the quantized spacetime description of the electronic structure of atoms the Ricci tensor equations involving the diagonal elements of the Ricci tensor combine to form a Schrodinger equation leading to quantization of the speed of light in the spacetime Using this result in Maxwell s equations produces an equation for photon frequency that is identical to the result from quantum theory for a hydrogen like atom effects of spin are not considered here governed by a set of integer parameters identical to the quantum numbers The expression for the energy of photons that are emitted or absorbed by this spacetime is obtained by matching curvature components between free and quantized spacetime environments resulting in a linear relationship between the energy and frequency of the photons Furthermore the solution is shown to conform to the Pauli exclusion principle so that Fermi Dirac statistics apply All of these features follow from requiring the Ricci tensor to be zero in six dimensions matching curvature components between quantized spacetime and free spacetime at the hypersurfaces and by applying the equations of motion
