**METEOROLOGICAL DATA ANALYSIS AND PREDICTION USING MACHINE LEARNING WITH PYTHON** Vivian Siahaan, Rismon Hasiholan Sianipar, 2023-07-31 In this meteorological data analysis and prediction project using machine learning with Python we begin by conducting data exploration to understand the dataset s structure and contents We load the dataset and check for any missing values or anomalies that may require preprocessing To gain insights into the data we visualize the distribution of each feature examining histograms box plots and scatter plots This helps us identify potential outliers and understand the relationships between different variables After data exploration we preprocess the dataset handling missing values through imputation techniques or removing rows with missing data ensuring the data is ready for machine learning algorithms Next we define the problem we want to solve which is predicting the weather summary based on various meteorological parameters The weather summary serves as our target variable while the other features act as input variables We split the data into training and testing sets to train the machine learning models on one subset and evaluate their performance on unseen data For the prediction task we start with simple machine learning models

like Logistic Regression or Decision Trees We fit these models to the training data and assess their accuracy on the test set To improve model performance we explore more complex algorithms such as Logistic Regression K Nearest Neighbors Support Vector Decision Trees Random Forests Gradient Boosting Extreme Gradient Boosting Light Gradient Boosting and Multi Layer Perceptron MLP We use grid search to tune the hyperparameters of these models and find the best combination that optimizes their performance During model evaluation we use metrics such as accuracy precision recall and F1 score to measure how well the models predict the weather summary To ensure robustness and reliability of the results we apply k fold cross validation where the dataset is divided into k subsets and each model is trained and evaluated k times Throughout the project we pay attention to potential issues like overfitting or underfitting striving to strike a balance between model complexity and generalization Visualizations play a crucial role in understanding the model s behavior and identifying areas for improvement We create various plots including learning curves and confusion matrices to interpret the model s performance In the prediction phase we apply the trained models to the test dataset to predict the weather summary for each sample We compare the predicted values with the actual values to assess the model s performance on unseen data The entire project is well documented ensuring transparency and reproducibility We record the methodologies findings and results to facilitate future reference or sharing with stakeholders We analyze the predictive capabilities of the models and summarize their strengths and limitations We discuss potential areas of improvement and future directions to enhance the model s accuracy and robustness The main objective of this project is to accurately predict weather summaries based on meteorological data while also gaining valuable insights into the underlying patterns and trends in the data By leveraging machine learning algorithms preprocessing techniques hyperparameter tuning and thorough evaluation we aim to build reliable models that can assist in weather forecasting and analysis
