Techniques In Variational Analysis:

Techniques of Variational Analysis Jonathan Borwein, Qiji Zhu, 2006-06-18 Borwein is an authority in the area of mathematical optimization and his book makes an important contribution to variational analysis Provides a good introduction to the topic

Semi-algebraic Techniques in Variational Analysis Chin How Jeffrey Pang, 2009 Variational Analysis is the modern theory of nonsmooth nonconvex analysis built on the theory of convex and smooth optimization While the general theory needs to handle pathologies functions and sets appearing in applications are typically structured Semi algebraic functions and sets eliminates much of the pathological behavior and still forms a broad class of constructs appearing in practice making it an ideal setting for practical variational analysis Chapter 1 is an introduction to the thesis and Chapter 2 reviews preliminaries Chapters 3 to 5 describe various semi algebraic techniques in variational analysis Chapter 3 gives equivalent conditions for the Lipschitz continuity of pseudospectra in the set valued sense As corollaries we give formulas for the Lipschitz constants of the pseudospectra pseudospectral abscissa and pseudospectral radius We also study critical points of the resolvent function Chapter 4 studies robust solutions of an optimization problem using the robust regularization of a function and prove that it is Lipschitz at a point for all small ϵ for nice functions and in particular semi algebraic functions This result generalizes some of the ideas in Chapter 3 Chapter 5 studies the continuity properties of set valued maps We prove that the set of points where a closed valued semi algebraic and more generally tame set valued map is not strictly continuous is a set of lower dimension As a by product of our analysis we prove a Sard type theorem for local Pareto minimums of scalar valued and vector valued functions Chapter 6 departs from the theoretical bent of the rest of the thesis and is computational We describe algorithms for computing critical points of mountain pass type We prove that sub level sets of a function coalesce at critical points of mountain pass type and discuss algorithmic implications In particular we propose a locally superlinearly convergent algorithm for smooth nondegenerate critical points of Morse index 1 We conclude this chapter by describing a strategy for the Wilkinson problem of finding the closest matrix with repeated eigenvalues

with slightly weaker assumptions or have strengthened the conclusions in a couple of instances
